This is composed of a short length of insulated wire connected to the osc. section of the tuning gang, and having its free end twisted around the mixer input grid lead.

ALTERATIONS.

In earlier models of this series it will be found that the resistor R (50,000 ohms), connected from the tap of the volume control R12 (1 megohm), is not present. This was added as from 4/5/'37. C23 (0.1 mfd., 600 v.) will be found to be a 0.1 mfd. 400 v. condenser in the earlier models. Should replacement be necessary, the higher rating unit is preferable. In later models of this series resistor R32 (25 ohms, w.w.) was replaced by a 10 ohms, w.w. resistor for the purpose of increasing the green illumination on S.W. position.
