| The state of the s |          |               |

The dc component must not exceed 100 volts.

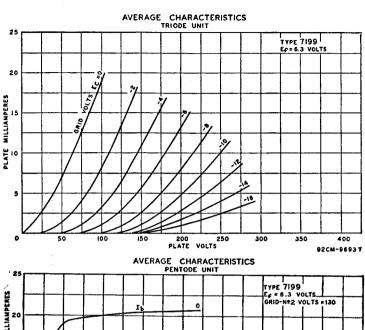

#### **EQUIVALENT-NOISE AND HUM VOLTAGE REFERENCED TO GRID:**

|                     | Triode Unit | Pentode Unit |    |
|---------------------|-------------|--------------|----|
| Median Value (rms)  | 10†         | 35•          | μV |
| Maximum Value (rms) | 150†        | 100◆         | μV |

- † Measured in "true rms" units under the following conditions: heater volts (ac), 6.3; center tap of heater transformer connected to ground; plate-supply volts, 250; plate load resistor, 0.1 megohm; cathode resistor, 1500 ohms; grid resistor, 0.05 megohm; and amplifier covering frequency range between 25 and 10000 cycles per second.
- Same conditions as for triode unit except: grid-No.2 supply volts, 250; grid-No.2 resistor, 0.33 megohm; grid-No.2-bypass capacitor, 0.22  $\mu$ F; cathode resistor, 1200 ohms; and grid-No.1 resistor, 0.05 megohm.

### Class A, Amplifier

### **MAXIMUM CIRCUIT VALUES:**

Grid-No.1-Circuit Resistance:\*

For fixed-bias operation

For cathode-bias operation

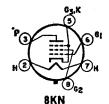

Triode Unit

0.5 max

0.25 max megohm

1.0 max megohm

<sup>\*</sup> If either unit is operated at maximum rated conditions, grid-No.1-circuit resistance for both units should not exceed the stated value.

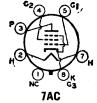

### **POWER PENTODE**

Glass octal type used in the poweroutput stage of high-fidelity audiofrequency amplifier systems. Outline 13F, Outlines section. Tube requires octal socket and may be mounted in any position. Heater volts (ac/dc), 6.3;

7355

amperes, 0.8; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

| Class A, Amplifie                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | r         |             |     |                  |

# **BEAM POWER TUBE**

Glass octal type used as output amplifier tube in high-quality sound systems. Outline 13D, Outlines section. Tube requires octal socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.45; peak

**7408** 

heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

• This value can be measured by a method involving a recurrent waveform such that the maximum ratings of the tube will not be exceeded.

# SHARP-CUTOFF PENTODE

**7543** 

Miniature type used in compact audio equipment, especially in low-hum, low-microphonic, high-gain, resistance-coupled-amplifier applications. Outline 5C, Outlines section. This type is identical with miniature type 6AU6A

except that it has a controlled hum characteristic.

### **HUM OUTPUT VOLTAGE:**

† Measured in "true rms" units under the following conditions: heater volts (ac), 6.3; center tap of heater transformer connected to ground; plate and grid-No.2 supply volts, 250; plate load resistor, 0.27 megohm; grid No.3 and internal shield connected to cathode at socket; grid-No.2 resistor, 0.68 megohm; grid-No.1 resistor, 0.1 megohm; cathode resistor, 1000 ohms; grid resistor of following stage, 10 megohms; and stage gain, 340.

• Same conditions as above except cathode resistor is unbypassed and stage gain is 110.

### POWER PENTODE

7591A

Glass octal types used as audio-frequency power-output tube in high-quality audio applications. Outline 13D, Outlines section. Tubes require octal socket and may be mounted in any position. Heater volts (ac/dc), 6.3;

8KQ

amperes, 0.8; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

### Class A, Amplifier

#### **MAXIMUM CIRCUIT VALUES:**

Grid-No.1-Circuit Resistance:

For fixed-bias operation 0.3 max megohm
For cathode-bias operation 1 max megohm

<sup>•</sup> In push-pull circuits where the grid No.2 of each tube is connected to a tap on the plate winding of the output transformer, this maximum rating is 440 volts.

<sup>•</sup> Grid No.2 input may reach 6 watts during peak levels of speech and music signals.

Structure of a Miniature Tube

# Electron Tube Testing

HE electron-tube user-service man. experimenter. or non-technical radio listener—is interested in knowing the condition of his tubes, since they govern the performance of the device in which they are used. In order to determine the condition of a tube, some method of test is necessary. Because the operating capabilities and design features of a tube are indicated and described by its electrical characteristics. a tube is tested by measuring its characteristics and comparing them with values established as standard for that type. Tubes which read abnormally high with respect to the standard for the type are subject to criticism just the same as tubes which are too low.

Certain practical limitations are placed on the accuracy with which a tube test can be correlated with actual tube performance. These limitations make it impractical for the service man and dealer to employ complex and costly testing equipment having laboratory accuracy. Because the accuracy of the tube-testing device need be no greater than the accuracy of the correlation between test results and receiver performance, and since certain fundamental characteristics are virtually fixed by the manufacturing technique of leading tube manufacturers, it is possible to employ a relatively simple test in order to determine the serviceability of a tube.

In view of these factors, dealers and service men will find it economically expedient to obtain adequate accuracy and simplicity of operation by employing a device which indicates the status of a single characteristic. Whether the tube is satisfactory or unsatisfactory is judged from the test result of this single characteristic. Consequently, it is

very desirable that the characteristic selected for the test be one which is truly representative of the tube's over-all condition.

The following information and circuits are given to describe and illustrate general theoretical and practical tubetester considerations and not to provide information on the construction of a home-made tube tester. In addition to the problem of determining what tube characteristic is most representative of performance capabilities in all types of receivers, the designer of a home-made tester faces the difficult problem of determining satisfactory limits for his particular tester. Getting information of this nature, if it is to be accurate and useful, is a big job. It requires the testing of many tubes of each type, testing of many types, and correlation of the data with performance in many kinds of equipment.

#### **Short-Circuit Test**

The fundamental circuit of a shortcircuit tester is shown in Fig. 106. Although this circuit is suitable for tet-

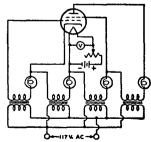

Fig. 106—Fundamental circuit of a shortcircuit tester.

rodes and types having less than four electrodes, tubes of more electrodes may be tested by adding more indicator lamps to the circuit. Voltages are applied between the various electrodes with lamps in series with the electrode leads. The value of the voltages applied will depend on the type of tube being tested and its maximum ratings. Any two shorted electrodes complete a circuit and light one or more lamps. Since two electrodes may be just touching to give a high-resistance short, it is desirable that the indicating lamps operate on very low current. It is also desirable to maintain the filament or heater of the tube at its operating temperature during the short-circuit test, because shortcircuits in a tube may sometimes occur only when the electrodes are heated. However, a short-circuit tester having too high a sensitivity may indicate veryhigh-resistance shorts that do not adversely affect tube operation.

### Selection of a Suitable Characteristic for Test

Some characteristics of a tube are far more important in determining its operating worth than are others. The cost of building a device to measure any one of the more important characteristics may be considerably higher than that of a device which measures a less representative characteristic. Consequently, three methods of test will be discussed, ranging from relatively simple and inexpensive equipment to more elaborate, more accurate, and more costly devices.

An emission test is perhaps the simplest method of indicating a tube's condition. (Refer to Diodes, in Electrons, Electrodes, and Electron Tubes section, for a discussion of electron emission.) Since emission falls off as the tube wears out, low emission is indicative of the end of tube serviceability. However, the emission test is subject to limitations because it tests the tube under static conditions and does not take into account the actual operation of the tube. On the one hand, coated filaments, or cathodes.

often develop active spots from which the emission is so great that the relatively small grid area adjacent to these spots cannot control the electron stream. Under these conditions, the total emission may indicate the tube to be normal although the tube is unsatisfactory. On the other hand, coated types of filaments are capable of such large emission that the tube will often operate satisfactorily after the emission has fallen far below the original value.

Fig. 107 shows the fundamental circuit diagram for an emission test. All of the electrodes of the tube, except the cathode, are connected to the plate. The filament, or heater, is operated at rated voltage; after the tube has reached con-

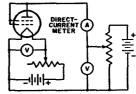

Fig. 107—Fundamental circuit of an emission tester

stant temperature, a low positive voltage is applied to the plate and the electron emission is read on the meter. Readings which are well below the average for a particular tube type indicate that the total number of available electrons has been so reduced that the tube is no longer able to function properly.

A transconductance test takes into account a fundamental operating principle of the tube. (This fact will be seen from the definition of transconductance in the Section on Electron Tube Characteristics.) It follows that transconductance tests, when properly made, permit better correlation between test results and actual performance than does a straight emission test.

There are two forms of transconductance test which can be utilized in a tube tester. In the first form (illustrated by Fig. 108 giving a fundamental circuit with a tetrode under test), appropriate operating voltages are applied to the electrodes of the tube. A plate current

depending upon the electrode voltages will then be indicated by the meter. If the bias on the grid is then shifted by the application of a different grid voltage, a new plate-current reading is obtained. The difference between the two plate-current readings is indicative of the transconductance of the tube. This

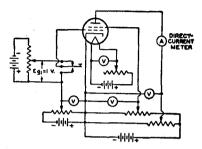

Fig. 108—Fundamental circuit of a transconductance tester using the "grid-shift" method.

method of transconductance testing is commonly called the "grid-shift" method, and depends on readings under static conditions. The fact that this form of test is made under static conditions imposes limitations not encountered in the second form of test made under dynamic conditions.

The dynamic transconductance test illustrated in Fig. 109 gives a fundamental circuit with a tetrode under test. This method is superior to the static transconductance test in that ac voltage

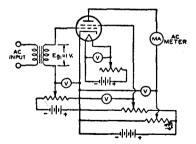

Fig. 109—Fundamental circuit of a dynamic transconductance tester.

is applied to the grid. Thus, the tube is tested under conditions which approximate actual operating conditions. The alternating component of the plate current is read by means of an ac ammeter of the dynamometer type. The transconductance of the tube is equal to the ac plate current divided by the input-signal voltage. If a one-volt rms signal is applied to the grid, the plate-current-meter reading in milliamperes multiplied by one thousand is the value of transconductance in micromhos.

The power-output test probably gives the best correlation between test results and actual operating performance of a tube. In the case of voltage amplifiers, the power output is indicative of the amplification and output voltages obtainable from the tube. In the case of power-output tubes, the performance of the tube is closely checked. Consequently, although more complicated to set up, the power-output test will give closer correlation with actual performance than any other single test.

Fig. 110 shows the fundamental circuit of a power-output test for class A operation of tubes. The diagram illustrates the method for a pentode. The ac output voltage developed across the

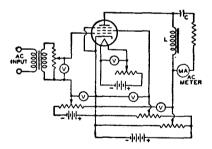

Fig. 110—Fundamental circuit of a poweroutput tester for class A operation of tubes.

plate-load impedance (L) is indicated by the current meter. The current meter is isolated as far as the dc plate current is concerned by the capacitor (C). The power output can be calculated from the current reading and known load resistance. In this way, it is possible to determine the operating condition of the tube quite accurately.

Fig. 111 shows the fundamental circuit of a power-output test for class B operation of tubes. With ac voltage

applied to the grid of the tube, the current in the plate circuit is read on a dc milliammeter. The power output of the tube is approximately equal to:

$$(I_{b^2} \times R_L)/0.405$$
,

where  $P_o$  is the power output in watts,  $I_b$  is the dc current in amperes, and  $R_L$  is the load resistance in ohms.

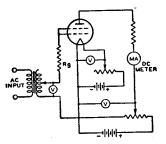

Fig. 111—Fundamental circuit of a poweroutput tester for class B operation of tubes.

### Essential Tube-Tester Requirements

- 1. The tester should provide for making a short-circuit test before measurement of the tube's characteristics.
- It is important that some means of controlling the voltages applied to the electrodes of the tube be provided. If

the tester is ac operated, a line-voltage control permits the supply of proper electrode voltages.

- 3. It is essential that the rated voltage applied to the filament or heater be maintained accurately.
- 4. It is suggested that the characteristics test follow one of the methods described. The method selected and the quality of the parts used in the test will depend upon the user's requirements.

### **Tube-Tester Limitations**

A tube-testing device can only indicate the difference between a given tube's characteristics and those which are standard for that particular type. Since the operating conditions imposed upon a tube of a given type may vary within wide limits, it is impossible for a tube-testing device to evaluate tubes in terms of performance capabilities for all applications. The tube tester, therefore, cannot be looked upon as a final authority in determining whether or not a tube is always satisfactory. Actual operating test in the equipment in which the tube is to be used will give the best possible indication of a tube's worth.

### Resistance-Coupled Amplifiers

RESISTANCE-COUPLED, audiofrequency voltage amplifiers utilize simple components and are capable of providing essentially uniform amplification over a relatively wide frequency range.

### Suitable Tubes

In this section, data are given for over 45 types of tubes suitable for use in resistance-coupled circuits. These types include low- and high-mu triodes, twin triodes, triode-connected pentodes, and pentodes. The accompanying key to tube types will assist in locating the appropriate data chart.

### Circuit Advantages

For most of the types shown, the data pertain to operation with cathode bias; for all of the pentodes, the data pertain to operation with series screengrid resistor. The use of a cathode-bias resistor where feasible and a series screen-grid resistor where applicable offers several advantages over fixed-voltage operation.

The advantages are: (1) effects of possible tube differences are minimized; (2) operation over a wide range of plate-supply voltages without appreciable change in gain is feasible; (3) the low frequency at which the amplifier cuts off is easily changed; and (4) tendency toward motorboating is minimized.

### **Number of Stages**

These advantages can be enhanced by the addition of suitable decoupling filters in the plate supply of each stage of a multi-stage amplifier. With proper filters, three or more amplifier stages can be operated from a single powersupply unit of conventional design with-

T = Triode Unit or Triode Connection
P = Pentode Unit or Pentode Connection

**KEY TO CHARTS** 

out encountering any difficulties due to coupling through the power unit. When decoupling filters are not used, not more than two stages should be operated from a single power-supply unit.

### Symbols Used in Resistance-Coupled Amplifier Charts

 $C = Blocking Capacitor (\mu f).$ 

 $C_k$  = Cathode Bypass Capacitor ( $\mu$ f).  $C_{ga}$  = Screen-Grid Bypass Capacitor

E<sub>bb</sub> = Plate-Supply Voltage (volts). Voltage at plate equals platesupply voltage minus drop in R<sub>p</sub> and R<sub>k</sub>.

 $R_k$  = Cathode Resistor (ohms).

R<sub>g2</sub> = Screen-Grid Resistor

(megohms).

R<sub>g</sub> = Grid Resistor (megohms) for following stage.

 $R_n$  = Plate Resistor (megohms).

V.G. = Voltage Gain.

E<sub>o</sub> = Output Voltage (peak volts).

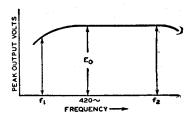

This voltage is obtained across R<sub>s</sub> (for following stage) at any frequency within the flat region of the output vs. frequency curve, and is for the condition where the signal level is adequate to swing the grid of the resistance-coupled amplifier tube to the point where its grid starts to draw current.

Note: The listed values for E<sub>0</sub> are the peak output voltages available when the grid is driven from a low-impedance source. The listed values for the cathode resistors are optimum for any signal source. With a high-impedance source, protection against severe distortion and loss of gain due to input loading may be obtained by the use of a coupling capacitor connected directly to the input grid and a high-value resistor connected between the grid and ground.

### **General Circuit Considerations**

In the discussions which follow, the frequency (f<sub>2</sub>) is that value at which the high-frequency response begins to fall off. The frequency (f<sub>1</sub>) is that value at which the low-frequency response drops below a satisfactory value, as discussed below. A variation of 10 per cent in values of resistors and capacitors has only slight effect on perform

ance. One-half-watt resistors are usually suitable for  $R_{g2}$ ,  $R_g$ ,  $R_p$ , and  $R_k$  resistors. Capacitors C and  $C_{g2}$  should have a working voltage equal to or greater than  $E_{bb}$ . Capacitor  $C_k$  may have a low working voltage in the order of 10 to 25 volts.

### Triode Amplifier Heater-Cathode Type

Capacitors C and  $C_k$  have been chosen to give an output voltage equal to  $0.8 E_0$  for a frequency  $(f_1)$  of 100 cycles. For any other value of  $f_1$ , multiply values of C and  $C_k$  by  $100/f_1$ . In

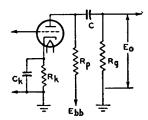

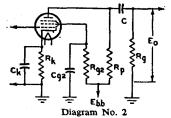

Diagram No. 1

the case of capacitor Ck, the values shown in the charts are for an amplifier with dc heater excitation; when ac is used, depending on the character of the associated circuit, the gain, and the value of f<sub>1</sub>, it may be necessary to increase the value of C<sub>k</sub> to minimize hum disturbances. It may be desirable to operate the heater at a positive voltage of from 15 to 40 volts with respect to the cathode. The voltage output at  $f_1$  of "n" like stages equals  $(0.8)^n \times E_0$ , where E<sub>0</sub> is the peak output voltage of final stage. For an amplifier of typical construction, the value of f2 is well above the audio-frequency range for any value of R<sub>p</sub>.

### **Pentode Amplifier**

Heater-Cathode Type

Capacitors C,  $C_k$ , and  $C_{g2}$  have been chosen to give an output voltage equal to  $0.7 \times E_o$  for a frequency  $(f_1)$  of 100 cycles. For any other value of  $f_1$ , multiply values of C,  $C_k$ , and  $C_{g2}$  by  $100/f_1$ . In the case of capacitor  $C_k$ , the values shown in the charts are for

an amplifier with dc heater excitation; when ac is used, depending on the character of the associated circuits, the voltage gain, and the value of f1, it may be necessary to increase the value of Ck to minimize hum disturbances. It may be desirable to operate the heater at a positive voltage of from 15 to 40 volts with respect to the cathode. The voltage output at f1 for "n" like stages equals  $(0.7)^n \times E_0$  where E<sub>0</sub> is peak output voltage of final stage. For an amplifier of typical construction, and for  $R_p$  values of 0.1, 0.25, and 0.5 megohm, approximate values of f2 are 20000, 10000, and 5000 cycles per second, respectively.

### Circuits

THE circuits included in this Manual illustrate some of the more important applications of RCA receiving tubes; they are not necessarily examples of commercial practice. These circuits have been conservatively designed and are capable of excellent performance. Electrical specifications are given for circuit components to assist those interested in home construction. Layouts and mechanical details are omitted because they vary widely with the requirements of individual set builders and with the sizes and shapes of the components employed.

Circuits designed for operation from both ac and dc voltage supplies should be installed in non-metallic cabinets or properly insulated from metallic cabinets. Potentiometer shafts and switches should make use of insulated (plastic) knobs. In practical use, no metallic part of an "ac/dc" chassis should be exposed to touch, accidental or otherwise. When such circuits are tested outside of their cabinets, a line isolation transformer such as the RCA WP-25A Isotap should be used.

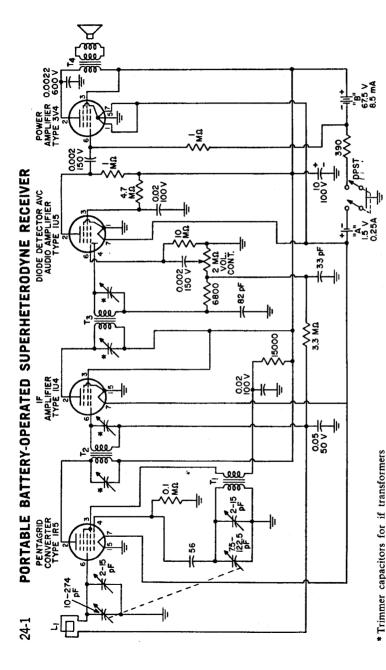

Performance of these circuits depends as much on the quality of the components selected and the care employed in layout and construction as on the circuits themselves. Good signal reproduction from receivers and amplifiers requires the use of good-quality speakers, transformers, chokes, and input sources (microphones, phonograph pickups, etc).

Coils for the receiver circuits may be purchased at local parts dealers by specifying the characteristics required: for rf coils, the circuit position (antenna or interstage), tuning range desired, and tuning capacitances employed; for if coils or transformers, the intermediate frequency, circuit position (1st if, 2nd if, etc.), and, in some cases, the associated tube types; for oscillator coils, the receiver tuning range, the intermediate frequency, the type of converter tube, and the type of winding used (tapped or transformer-coupled).

The voltage ratings specified for capacitors are the minimum dc working voltages required. Paper, mica, or ceramic capacitors having higher voltage ratings than those specified may be used except insofar as the physical sizes of such capacitors may affect equipment layout. However, if electrolytic capacitors having substantially higher voltage ratings than those specified are used. they may not "form" completely at the operating voltage, with the result that the effective capacitances of such units may be below their rated value. The wattage ratings specified for resistors assume methods of construction that provide adequate ventilation; compact installations having poor ventilation may require resistors of higher wattage ratings.

Circuits which work at very high frequencies or which are required to handle very wide bandwidths demand more than ordinary skill and experience in construction. Placement of component parts is quite critical and may require considerable experimentation. All rf leads to components including bypass capacitors must be kept short and must be properly dressed to minimize undesirable coupling and capacitance effects. Correct circuit alignment and oscillator tracking may require the use of a cathode-ray oscilloscope, a high-impedance vacuum-tube voltmeter, and a signal generator capable of supplying a properly modulated signal at the appropriate frequencies. Unless the builder has had considerable experience with broadband, high-frequency circuits, he should not undertake the construction of such circuits.

|                | LIST OF CIRCUITS                                                               | Page       |

| 24-10          | Intercommunication Set (With Master Unit and Two or More Remote                |            |
|                | Units)                                                                         | 533        |
| 24-11          | High-Fidelity Audio Amplifier (Class AB <sub>1</sub> ; Power Output, 15 Watts) | 534        |
| 24-12          | High-Fidelity Audio Amplifier (Class AB; Power Output, 30 Watts)               | 535        |
| 24-13          | High-Fidelity Audio Amplifier (Class AB; Power Output, 50 Watts)               | 536        |
| 24-14          | Two-Channel Audio Mixer                                                        | 538        |
| 24-15          | Two-Channel Stereophonic Amplifier (Power Output, 1 Watt Each                  |            |
|                | Channel)                                                                       | 539        |
| 24-16          | Microphone and Phonograph Amplifier (Power Output, 8 Watts)                    | 540        |
| 24-17          | Phonograph Amplifier (Power Output, 1 Watt)                                    | 541        |
| 24-18          | Preamplifier for Magnetic Phonograph Pickup (With RIAA Equali-                 |            |
|                | zation)                                                                        | 542        |
| 24-19          | Preamplifier for Ceramic Phonograph Pickup (Cathode-Follower                   |            |
|                | Output)                                                                        | 543        |
| 24-20          | Two-Stage Input Amplifier (Cathode-Follower Output)                            | 544        |
| 24-21          | Low-Distortion Preamplifier (For Low-Output, High-Impedance                    |            |
|                | Microphones)                                                                   | 544        |
| 24-22          | Bass and Treble Tone-Control Amplifier                                         | 545        |
| 24-23          | Audio Control Unit (With Volume and Tone Controls)                             | 546        |
| 24-24          | VHF Tuner (For Black-and-White TV Receiver)                                    | 548        |
| 24-25          | Video IF Amplifiers and Sound-Channel Circuits (For Black-and-                 |            |
|                | White TV Receiver)                                                             | 550        |
| 24-26          | Video, AGC, and Sync Amplifiers (For Black-and-White TV                        |            |
|                | Receiver)                                                                      | 551        |
| 24-27          | Vertical and Horizontal Deflection Circuits and High-Voltage (For              | 552        |
| 04.00          | Black-and-White TV Receiver)                                                   |            |
| 24-28          | Low-Voltage and Heater Supply (For Black-and-White TV Re-                      | 553        |
| 24.20          | ceiver)                                                                        |            |
| 24-29          | Sine- Square-Wave Audio Signal Generator                                       | 554<br>446 |
| 24-30          | Electronic Volt-Ohm Meter                                                      | 558        |
| 24-31<br>24-32 | Cathode-Ray Oscilloscope                                                       |            |
| Z4=5Z          | AU-PUIDONE POWER SUDDIV                                                        | 200        |

Notes: 1. Resistance in ohms and capacitance in microfarads unless specified.

2. All resistors 0.5 watt unless otherwise specified.

122.5-pF tuning capacitor and 455- $T_1 = Oscillator$  coil for use with 7.5- to L2T3 = Intermediate-frequency transformkc/s if transformer

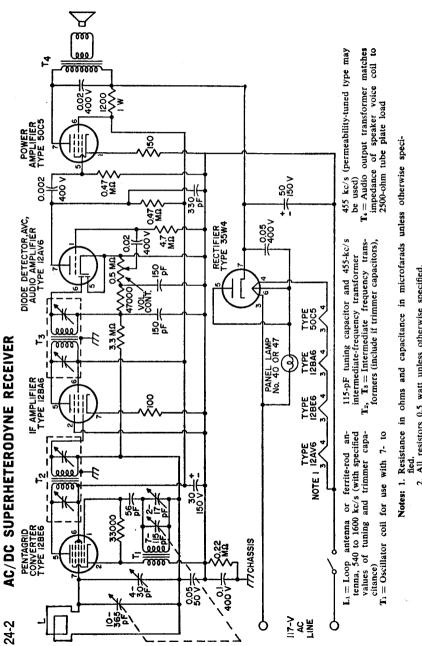

L<sub>1</sub> = Loop antenna or ferrite-rod antenna, 540 to 1600 kc/s (with specified values of tuning and trimmer

capacitance)

T<sub>1</sub> = Audio output transformer, matches impedance of speaker voice coil to 10000-ohm tube plate load

ers, 455 kc/s (permeability-tuned types

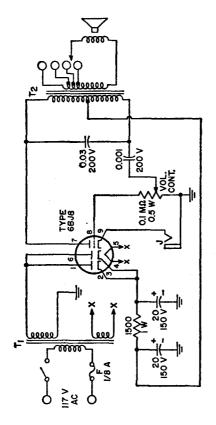

may be used)

All resistors 0.5 watt unless otherwise specified.

3. The following tube types may be used for a 100-mA heater complement: 18FX6A converter, 18FW6A if amplifier, 18FY6A detector and audio ampliffer, 34GD5A power amplifier, and 36AM3B rectifier.

## CODE-PRACTICE OSCILLATOR

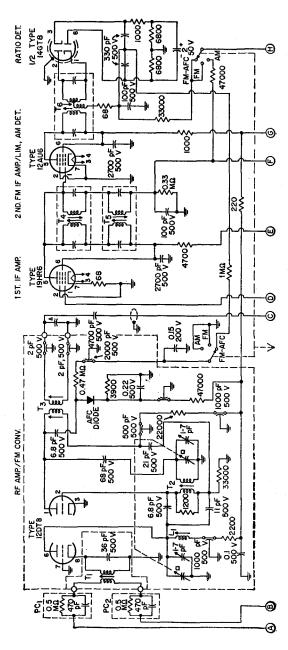

T<sub>1</sub> = Power transformer, 125 volts rms, 15 mA; 6.3 volts, 0.6 ampere T<sub>2</sub> = Universal output transformer

Notes: 1. Any two terminals of the secondary of T<sub>2</sub> that give the desired tone may be selected. Adjustment of volume control may cause a slight change in tone.

2. Resistance in ohms and capacitance in microfarads unless otherwise specified.

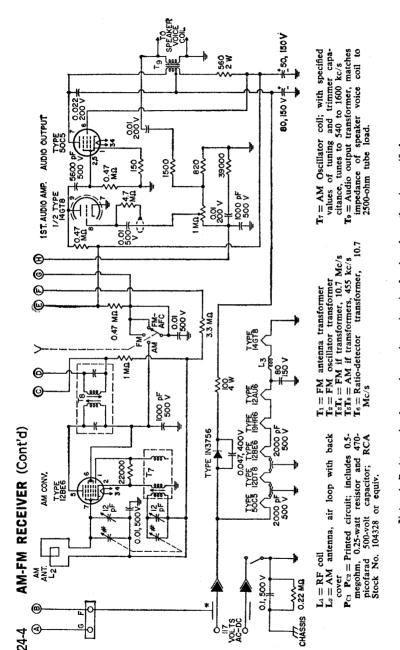

AM/FM RECEIVER

24-4

# Ganged tuning capacitors; tune AM antenna (L2) and T<sub>7</sub> to 540 to 1650 kc/s A IF transformer tuning capacitor; value, with cable capacitance, tunes T<sub>2</sub> to Ganged tuning capacitors; tune L, and T2 to 80 to 108 Mc/s 10.7 Mc/s.

\*On FM, the ac line serves as an FM antenna by means of a special line cord having a third wire which is not physically connected to the line. Alternatively, an external FM antenna may be connected to terminals G and F with the connection to the third wire of the power cord omitted.

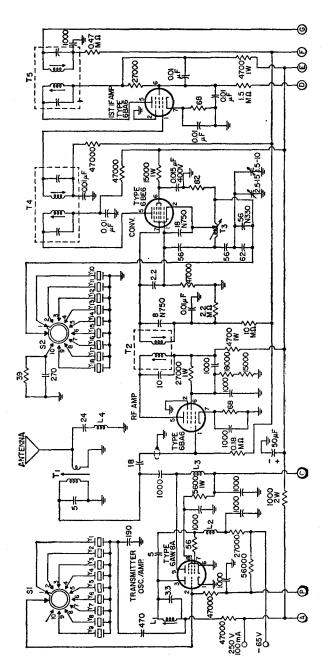

Notes: 1. Resistance in ohms and capacitance in microfarads unless otherwise specified.

2. All resistors 0.5 watt, ±10% unless otherwise specified.

3. See general considerations for construction of high-frequency and broadband

circuits on page 519.

24-5

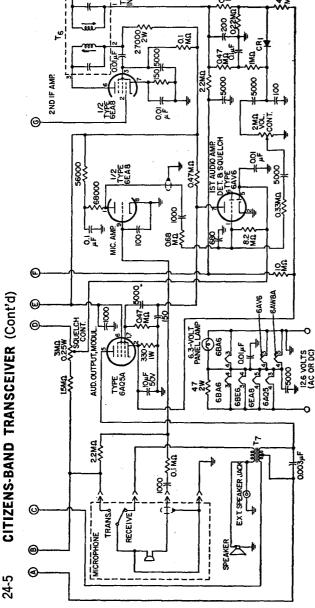

Notes: 1. Resistance in ohms and capacitance in picofarads unless otherwise specified.

2. All fixed resistors are 0.5 watt and all capacitors 500 voits unless otherwise

specified. 6

See general considerations for construction of high-frequency and broadband circuits on page 519.

FCC regulations require that the transmitting crystals are installed and the operating frequency checked by or under the supervision of a person who holds a second-class (or higher) commercial radio operator's license. 4

CITIZENS-BAND TRANSCEIVER (Cont'd)

S2 == Rotary switch, receiver channel selector, RCA stock No. 226189 or output transformer, T2 = RF interstage transformer, 26.965 to 27.255 Mc/s, RCA stock No. 226191 RCA stock No. 226184 or equiv. T<sub>1</sub> = Transmitter equiv.

RCA

L<sub>1</sub> = Transmitter oscillator coil, CR1 =Crystal diode, type 1N34

stock No. 226183 or equiv.

 $L_2L_3=RF$  choke, 500  $\mu H$ No. 226187 or equiv.

mary and secondary capacitors), 1650 Ye = Transmitting crystals. T<sub>1</sub> = Audio output transformer, centertapped primary, matches impedance of speaker voice coil to 5000-ohm tube oad, RCA stock No. 226224 or equiv. Yn through Y18 = Receiving crystals. kc/s, RCA stock 226193 or equiv. T.T.F. = IF transformer (includes Y<sub>1</sub> through T3 = Receiver oscillator coil, RCA stock

No. 226192 or equiv.

This transceiver is similar to the RCA "mark nine" Citizens-Band 2-Way Radio,

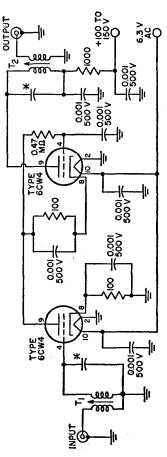

or equiv.

S1 = Rotary switch, transmitter channel L<sub>i</sub> = Second-harmonic trap, RCA stock

selector, RCA stock No. 226189 or

# PREAMPLIFIER FOR AMATEUR RECEIVER

10- and 6-Meter (30- and 50-Mc/s) Amateur Bands and 27-Mc/s Citizens Band

ondary of each transformer; for operation at 50 Mc/s, use 5-pF 500-volt capacitor across secondary of T<sub>1</sub> and 6.8-pF 500-volt capacitor across secondary of T<sub>2</sub>. \* For operation at 27 Mc/s, use 6.8-pF 500-volt capacitors across secondaries of T<sub>1</sub> and T<sub>2</sub>, for operation at 30 Mc/s, use 5-pF 500-volt capacitor across sec-

to across second natches preamplifier to 52-ohn input ine (for 300-ohm input line (for 300-ohm input line, double number of turns in primary); wound from #32 copper enamel wire on slugtuned form having ¼-inch outer diameter; primary, ½ turns, secondary, 18

turns for operation at 27 or 30 Mc/s or 10 turns for operation at 27 or 30 Mc/s or 10 turns for operation at 50 Mc/s matches preamplifier to 72-ohm output line (use of other than a 72-ohm line between preamplifier output and receiver input is not recommended);

wound from #32 copper enamel wire on slug-tuned form having ¼-inch outer diameter; primary, 18 turns for operation at 27 or 30 Mc/s or 10 turns for operation at 50 Mc/s; secondary, 1½ turns

mmended); totales otherwise specified.

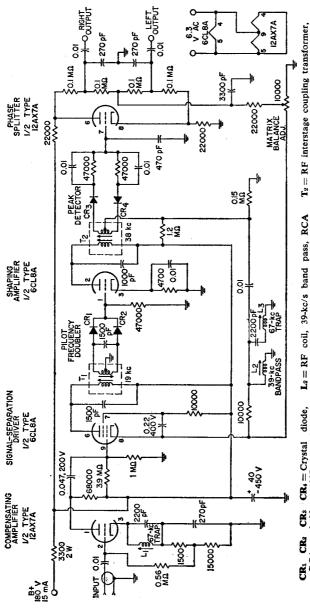

Notes: 1. Resistance in ohms and capacitance in microfarads unless otherwise specified.

2. All resistors 0.5 watt unless otherwise specified.

 See general considerations for construction of high-frequency and broadband circuits on page 519.

### TELEVISION CIRCUITS 24-24 to 24-28

Circuits 24-24 through 24-28 are essentially identical to the corresponding circuits in the RCA-KCS-152 Television Receiver. These circuits comprise a complete television receiver with the exception of the deflection coils and the picture tube. Portions of any television receiver, however, are required to operate over an extremely wide range of very high frequencies. The construction of such circuits requires more than ordinary skill and experience and the use of sophisticated test equipment (see general consideration for the construction of high-frequency and broadband circuits on page 519). Home construction of such circuits is not recommended unless the builder has had considerable experience in this type of work.

The chassis of circuits 24-24 through 24-28 are connected to one side of the ac line during operation. Servicing of these circuits should not be attempted by persons not familiar with the precautions necessary when working on this type of equipment.

- An isolation transformer should be inserted between the receiver and the ac line before any servicing is attempted.
- 2. If the receiver must be operated directly from the ac supply, the power plug should be inserted in the proper direction to connect the chassis to the ground side of the ac line. Use an ac voltmeter to measure the voltage between the chassis and the power-source ground; no voltage reading should be obtained. If a reading is obtained, reverse the power plug, and recheck for a zero reading.

For further information on television circuits, the reader should consult the text sections in this manual

### **RCA** Technical Publications

### on Electron Tubes, Semiconductor Products, and Batteries

COPIES of the publications listed below may be obtained from your RCA distributor or from Commercial Engineering, Radio Corporation of America, Harrison, N. J.

### **Electron Tubes**

- RCA ELECTRON TUBE HANDBOOK -HB-3 (7%" x 5%"). Five 21/4-inchcapacity binders. Contains over 5000 pages of looseleaf data and curves on RCA receiving tubes, transmitting tubes, cathode-ray tubes, picture tubes, photocells, phototubes, camera tubes, ignitrons, vacuum gas rectifiers, travelingwave tubes, premium tubes, pencil tubes, and other miscellaneous types for special applications. Available on subscription basis. Price \$20.00\* including service for first year. Also available with RCA Semiconductor Products Handbook HB-10 at special combination price of \$25.00.\*
- RADIOTRON° DESIGNER'S HAND-BOOK—4th Edition (834" x 5½")—1500 pages. Comprehensive reference covering the design of radio and audio circuits and equipment. Written for the design engineer, student, and experimenter. Contains 1000 illustrations, 2500 references, and cross-referenced index of 7000 entries. Edited by F. Langford-Smith. Price ¶7.00.\*†
- RCA PHOTOTUBE AND PHOTOCELL MANUAL—PT-60 (8½" x 5¾")—192 pages. Well-illustrated informative manual covering fundamentals and operating considerations for vacuum and gas phototubes, multiplier phototubes, and photocells. Also describes basic appli-

cations for these devices. Features easy-to-use selection chart for multiplier phototubes. Data and performance curves given for over 90 photo-sensitive devices. Price \$1.50.\*†

- RCA TRANSMITTING TUBES—TT-5 (81/4" x 5%")—320 pages. Gives data on over 180 power tubes having plate-input ratings up to 4 kw and on associated rectifier tubes. Provides basic information on generic types, parts and materials, installation and application, and interpretation of data. Contains circuit diagrams for transmitting and industrial applications. Features lie-flat binding. Price \$1.00.\*†
- RCA INTERCHANGEABILITY DIRECTORY OF INDUSTRIAL-TYPE ELECTRON TUBES—ID-1020-F (10%" x 83%")—12 pages. Lists more than 2300 basic type designations for 20 classes of industrial tube types; shows the RCA Direct Replacement Type or the RCA Similar Type, when available. Price 15 cents.\*†
- RCA INDUSTRIAL RECEIVING-TYPE TUBES—RIT 104P (10%" x 83%")—52 pages. Technical information on over 200 RCA "special red" tubes, premium tubes, nuvistors, computer tubes, pencil tubes, glow-discharge tubes, small thyratrons, low-microphonic amplifier tubes, mobile communications tubes, and other special types. Includes socket-connection diagrams. Price 40 cents.\*†
- RCA RECEIVING TUBES AND PICTURE TUBES—1275L (10%" x 83%")—56 pages. New, enlarged, and up-to-date booklet contains classification chart, application guide, characteristics chart, and base and envelope connec-

tion diagrams on more than 1300 entertainment receiving tubes and picture tubes. Price 50 cents.\*†

- RCA INTERCHANGEABILITY DIRECTORY OF FOREIGN vs. U.S.A. RECEIVING-TYPE ELECTRON TUBES—1CE-197D (8%" x 10%")—8 pages. Covers approximately 800 foreign tube types used principally in AM and FM radios. TV receivers, and audio amplifiers. Indicates U.S.A. direct replacement type or similar type if available. Price 10 cents.\*
- RCA PHOTOCELLS—CSS-800 (10%" x 8%")—36 pages. Contains a selection of photocell-circuit diagrams; technical data and characteristic curves of RCA photoconductive, photojunction, and photovoltaic cells; interchangeability information. Also contains representative circuits. Price 40 cents.\*†
- RCA NUVISTOR TUBES FOR INDUSTRIAL AND MILITARY APPLICATIONS—1CE-280 (10%" x 8%")—16 pages. Describes unique features of nuvistors and includes tabular data, dimensional outlines, curves, terminal diagrams, and socket information. Price 25 cents.\*†
- RCA COMMAND TUBES—RIT-105—36 pages. Detailed technical data for six "command" types including types 12AT7WA, 5G54, 5670, 5751, 5814A, and 6136. These types are interded for use in critical industrial, aircraft, and other equipment requiring exceptional stability and reliability under severe environmental conditions. Price 40 cents.\*
- RCA NOVAR TUBES—1CE-311—12 pages. Describes unique features of novar tube types and includes tabular data, dimensional outlines, curves, and terminal diagrams. Single copy free on request.
- RCA PHOTOMULTIPLIER AND IMAGE TUBES—PIT-700 (10%" x 83%")—36 pages. Includes concise data on RCA photomultiplier tubes, gas and vacuum photodiodes, sockets and shields for phototubes, and dimensional outlines for photo and image tubes. Price 60 cents.\*

- PRODUCT GUIDE FOR RCA POWER TUBES—PWR-506A—32 pages. Contains tabulated data on all RCA power tubes in order of type designation within each general class of service. Includes maximum ratings, temperature ratings, heater or filament requirements, outline drawings, and basing diagrams. Price 15 cents.\*
- RCA INDUSTRIAL TUBES PRODUCT GUIDE—TPG-200 (10%" x 83%")—28 pages. Covers all RCA industrial-tube product lines. Gives a brief description of each product line together with quick-selection data. Single copy free on request.
- RCA POWER TUBES CLASSIFICATION CHARTS—PWR-504—12 pages. Groups all power tube types by their rated classes of service and lists them in order of power capability. Price 15 cents.\*
- RCA STORAGE TUBES AND CATHODE-RAY TUBES—STC-900A—16 pages. Contains technical information on RCA storage tubes, special-purpose kinescopes and oscillograph-type cathoderay tubes including display-storage tubes, computer-storage tubes, radechons, scan conversion tubes, flying-spot tubes, monitor, projection, transcriber, and view-finder kinescopes; as well as data on fluorescent screens. Price 25 cents.\*
- RCA TRAVELING-WAVE TUBE CLASSI-FICATION CHARTS—MWD-101A—4 pages. Contains catalog-type data. Single copy free on request.
- RCA PENCIL TUBE CLASSIFICATION CHARTS—MWD-102—2 pages. Contains catalog-type data. Single copy free on request.
- RCA SOLID-STATE DEVICE CLASSIFI-CATION CHARTS—MWD-104A—2 pages. Contains catalog-type data for solid-state microwave devices. Single copy free on request.
- RCA CAMERA TUBES—CAM-600—16 pages. Contains classification charts, defining data and typical characteristic curves for RCA image orthicons and vidicons. Camera tubes recommended

for new equipment design are highlighted. Price 50 cents.\*

• TECHNICAL BULLETINS—Authorized information on RCA receiving tubes, transmitting tubes, and other tubes for communications and industry. Be sure to mention tube-type bulletin desired. Single-copy on any type free on request.

### Semiconductor Products

- RCA SEMICONDUCTOR PRODUCTS HANDBOOK—HB-10. Two binders, each 73%" L x 55%" W x 23%" D. Contains over 1000 pages of loose-leaf data and curves on RCA semiconductor devices such as transistors, silicon rectifiers, and semiconductor diodes. Available on a subscription basis. Price \$10.00\* including service for first year. Also available with RCA Electron Tube Handbook HB-3 at special combination price of \$25.00.\*
- RCA TRANSISTOR MANUAL—SC-11 (83%" x 53%")—384 pages. Contains up-to-date definitive data on over 600 semiconductor devices including tunnel diodes, silicon controlled rectifiers, varactor diodes, conventional rectifiers, and many classes of transistors. Features easy-to-understand text chapters, as well as tabular data on RCA discontinued transistors. Contains over 40 practical circuits, complete with parts lists, highlighting semiconductor-device applications. Price \$1.50.\*†
- RCA TUNNEL DIODE MANUAL—TD-30 (8%" x 53%")—160 pages. Describes the microwave and switching capabilities of tunnel diodes. Contains information on theory and characteristics, and on tunnel-diode applications in switching circuits and in microwave oscillator, converter, and amplifier circuits. Includes data for over 40 RCA germanium and gallium arsenide tunnel diodes and tunnel rectifiers. Price \$1.50.\*†
- RCA SEMICONDUCTOR PRODUCTS GUIDE—SPG201/IL1147B (10%" x 8%")—20 pages. Contains classification chart, index, and ratings and characteristics on RCA's line of transistors.

- silicon rectifiers, semiconductor diodes, and photocells. Single copy free on request.
- RCA SILICON RECTIFIERS—62S25—6 pages. Describes RCA's line of diffused-junction rectifiers. Includes maximum ratings and characteristics plus rectifier circuit chart which shows voltage and current relationships together with waveforms for single and polyphase rectifier circuits. Single copy free on request.
- RCA SILICON RECTIFIER INTER-CHANGEABILITY DIRECTORY — 1CE-229A—16 pages. Contains replacement information, ratings, characteristics, and physical dimensions for more than 400 silicon and selenium rectifiers. Price 25 cents.\*
- RCA SILICON POWER RECTIFIERS—62S10—8 pages. Contains technical data on RCA's line of diffused-junction silicon power rectifiers. Includes quick-selection guide for stud-type and high-voltage "stack" and "stick" type rectifiers. Single copy free on request.
- RCA DIFFUSED-JUNCTION SILICON RECTIFIER STACKS AND BRIDGES—SRS-300—10 pages. Contains technical data on RCA's diffused-junction silicon rectifier stacks and bridges. Characteristics of basic rectifier circuits are also given to assist in selection of proper RCA rectifier device. Price 20 cents.\*
- RCA SMALL-SIGNAL SILICON N-P-N TRANSISTORS—SST-210—8 pages. Contains technical data on 2N2102 family of silicon transistors including high-voltage types, very-high voltage types, linear-beta types, and general types. Also includes quick-reference guide. Price 20 cents.\*

### **Batteries**

• RCA BATTERY MANUAL—BDG-111 (10%" x 834")—64 pages. Contains information on dry cells and batteries [carbon zinc (Leclanché), mercury, and alkaline types]. Includes battery theory and applications, detailed electrical and mechanical characteristics, a classification chart, dimensional out-

| lines, and terminal connections on each battery type. Price 50 cents.*†            | WR-99A (Marker Calibrator)1.00*                    |
|------------------------------------------------------------------------------------|----------------------------------------------------|
| • RCA BATTERIES—BAT-134G (10%"                                                     | WT-100A (Electron-Tube Micro<br>Mho Meter)1.75*    |
| x 83/8"—32 pages. Technical data on                                                | WT-100A (Electron-Tube Micro                       |
| 142 Leclanché, alkaline, and mercury-<br>type dry batteries for radios, industrial | Mho Meter, Ser. No.                                |
| applications, flashlights, lanterns, and                                           | 1001 and over)2.00*                                |
| for photoflash service. Price 35 cents.*†                                          | WT-100A (Tube Chart                                |
| Test and Measuring                                                                 | 1CE-163)3.00*                                      |

Subscripts for multi-unit types: B, beam unit; D, diode unit; HP, heptode unit; HX, hexode unit; P, pentode unit; T, triode unit; TR, tetrode unit.

Many tube types are available in addition to the home-entertainment types described in this manual. For industrial and specialized applications, other small receiving-type tubes are available, such as nuvistor tubes, "premium" tubes, thyratrons, cold-cathode (glow-discharge) tubes, computer tubes, tubes for mobile communications applications, and Special Red tubes. Other lines of RCA electron devices include:

### **POWER TUBES**

Transmitting and Industrial Types

### TELEVISION CAMERA TUBES

Image Orthicons, Vidicons, and Monoscopes

### **PHOTOTUBES**

Single-Unit, Twin-Unit, and Multiplier Types

### **PHOTOCELLS**

Photoconductive and Photojunction Types

### THYRATRONS and IGNITRONS

### MICROWAVE TUBES

Magnetrons, Traveling-Wave
Tubes, Pencil Tubes

### **CATHODE-RAY TUBES**

Special-Purpose Kinescopes, Storage Tubes, and Oscillograph Types

### SPECIAL TYPES

Vacuum Gauge Tubes, Image Converters

### SEMICONDUCTOR DEVICES

Germanium and Silicon Transistors, Silicon Rectifiers, Tunnel Diodes, Silicon Controlled Rectifiers, Memory Devices

### RADIO CORPORATION, OF AMERICA

ELECTRONIC COMPONENTS AND DEVICES
