<sup>\*</sup> In half-wave service, the two units may be used separately or in parallel.

### Installation and Application

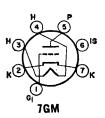

Type 6H6 requires an octal socket and may be mounted in any position. Outline 29B, Outlines section.

For detection, the diodes may be utilized in a full-wave circuit or in a half-wave circuit. In the latter case, one plate only, or the two plates in parallel, may be employed. For the same signal voltage, the use of the half-wave arrangement will provide approximately twice the rectified voltage as compared with the full-wave arrangement.

For automatic volume control, the 6H6 may be used in circuits similar to those employed for any of the twin-diode types of tubes. The only difference is that the 6H6 is more adaptable because each diode has its own separate cathode.

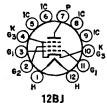

#### HIGH-MU TRIODE

6HA5 Related types: 2HA5, 3HA5, 4HA5 Miniature type used as rf-amplifier tube in vhf television tuners. Outline 5A, Outlines section. Tube requires miniature seven-contact socket and may be mounted in any position. Type 6HA5 and related type 3HA5

 $<sup>^{\</sup>circ}$  When a filter-input capacitor larger than 40  $\mu F$  is used, it may be necessary to use more plate-supply impedance than the value shown to limit the peak plate current to the rated value.

are electrically identical with types 6HM5/6HA5 and 3HM5/3HA5, respectively. Related types 2HA5 and 4HA5 are electrically identical with type 6HA5 except for heater voltages of 2.2 and 3.9 volts and heater currents of 0.6 and 0.3 ampere, respectively.

### **BEAM POWER TUBE**

Duodecar type used as horizontal-deflection amplifier in television receivers. Outline 15B, Outlines section. Tube requires duodecar twelve-contact socket and may be mounted in any position. Type 21HB5 is identical

| For fixed-bias operation                     | 1 m    | nax | megohm |

For cathode-bias operation ..... # The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds. † An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

### **BEAM POWER TUBE**

Duodecar type used as horizontal-deflection amplifier in color television receivers. Outline 16B, Outlines section. Tube requires duodecar twelvecontact socket and may be mounted in any position. Heater volts (ac/dc),

6HF5

1 max megohm

2.2 max megohms

6.3; amperes, 2.25; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

### Class A, Amplifier

#### **MAXIMUM CIRCUIT VALUES:**

Grid-Circuit Resistance:

\*\* Measured at 200 Mc/s with plate effectively grounded for rf voltages. # For a neutralized triode amplifier at a frequency of 200 Mc/s with signal source impedance adjusted for minimum noise output.

### MEDIUM-MU TRIODE— SHARP-CUTOFF PENTODE

Miniature type used in a wide variety of applications in television receivers employing series-connected heater strings. The triode unit is used as a sync-separator or voltage-amplifier tube, and the pentode unit is used as

6HL8

a video if-amplifier, agc-amplifier, or reactance tube. Outline 6B, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.6; warm-up time (average), 11 seconds; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

## SHARP-CUTOFF PENTODE

6HZ6

Miniature type used as sound-detector tube in FM and television receivers employing series-connected heater strings. Tube has two independent control grids. Outline 5C, Outlines section. Tube requires miniature seven-contact socket and may be mounted in any position.

7EN

### PENTODE— BEAM POWER TUBE

Duodecar type used in FM and television receivers. The pentode unit is
used as a gated-beam discriminator
and the beam power unit is used in
audio power-output stages in FM and
television limiter and discriminator

OJIU Related type: 13J10

applications. Outline 8B, Outlines section. Tube requires duodecar twelve-contact socket and may be mounted in any position. Type 13J10 is identical with type 6J10 except for heater ratings, as shown below.

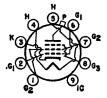

|                               | 6J 10 | 13310 |         |
|-------------------------------|-------|-------|---------|
| Heater Voltage (ac/dc)        | 6.3   | 13.2  | volts   |
| Heater Current                | 0.95  | 0.45  | ampere  |
| Heater Warm-up Time (Average) |       | 11    | seconds |

| Peak Heater-Cathode                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Voltage: #### MAXIMUM CIRCUIT VALUES:

Grid-No.1-Circuit Resistance:

# The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.

† For horizontal-deflection service, a positive voltage may be applied to grid No.3 to minimize "snivets" intereference in both vhf and uhf television receivers. A typical value for this purpose is 30 volts.

• An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

| MAXIMUM CIRCUIT VALUES:                                          |           |         |
| Grid-No.1-Circuit Resistance:                                    |           |         |
| For grid-resistor-bias operation                                 | 0.47 max  | megohm  |
| For plate-pulsed operation (horizontal-deflection circuits only) | 10 max    | megohms |

- The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.
- In this service, a positive voltage may be applied to grid No.3 to minimize "snivets" interference; a typical value for this voltage is 30 volts.
- □ An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

### HIGH-MU TRIODE-SHARP-CUTOFF PENTODE

Miniature type used in television receivers. The triode unit is used as a voltage amplifier or sync separator, and the pentode unit as a video amplifier. Outline 6E, Outlines section. Tube requires miniature nine-contact

The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle.

- ☐ The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.
- In a horizontal-deflection-amplifier service, a positive voltage (typical value, 30 volts) may be applied to grid No.3 to reduce "snivets" interference, which may occur in both vhf and uhf television receivers.
- † An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

#### SEMIREMOTE-CUTOFF PENTODE 6)G2 Miniature type used in the gain-controlled picture if-amplifier stages of 6.1H6 television receivers. Outline 5C, Outlines section. #The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.

## An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

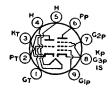

#### **BEAM POWER TUBE**

Duodecar type used as horizontalamplifier tube in television receivers. Outline 15A, **Outlines** section. Tube requires duodecar twelve-contact socket and may be mounted in any position. This type is electrically identical with

6JN6 Related types: 12JN6, 17JN6

type 6JM6 except that it has a slightly lower grid-No.1 to plate capacitance. Types 12JN6 and 17JN6 are identical with type 6JN6 except for heater ratings, as shown below.

| Heater Current | (ac/dc) Time (Average) | 1.2 | 12.6<br>0.6<br>11 | 173 N6<br>16.8<br>0.45<br>11 | volts<br>ampere<br>seconds |

#### MAXIMUM CIRCUIT VALUE:

Grid-No.1-Circuit Resistance:

For grid-resistor-bias operation .....

1 max megohm

- # The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.
- A positive voltage may be applied to grid No.3 to reduce interference from "snivets" which may occur in television receivers. A typical value for this voltage is 30 volts.
- † An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

### HIGH-MU TRIODE— SHARP-CUTOFF PENTODE

Miniature type with frame-grid pentode unit used in television receivers. The triode unit is used as a voltageamplifier or sync-separator tube, and the pentode unit is used as a videoamplifier tube. Outline 10A, Outlines

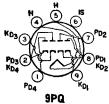

**6JT8** 

section, except base is small-button miniature 9-pin. Tube requires miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.725; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

### Class A, Amplifier

### HIGH-MU TRIODE— SHARP-CUTOFF PENTODE

6JV8
Related type:

Miniature type used in a wide variety of applications in television receivers, particularly those having low-voltage "B" supplies and employing seriesconnected heater strings. The triode unit is used in sound-if, keyed-agc,

sync-separator, sync-amplifier, and noise-suppression circuits. The pentode unit is especially useful as a video amplifier tube. Outline 6E, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position. Type 8JV8 is identical with type 6JV8 except for the heater ratings, as shown below.

1 max

### MEDIUM-MU TRIODE-**BEAM POWER TUBE**

Duodecar type used in combined ver-67 tical-deflection-oscillator and verticaldeflection-amplifier applications in television receivers. Outline 8B, Outlines section. Tube requires duodecar twelve-contact socket and may be

6JZ8

mounted in any position. Heater volts (ac/dc), 6.3; amperes, 1.2; peak heatercathode volts, 200 (the dc component must not exceed 100 volts when heater is positive with respect to cathode).

| Class A <sub>1</sub>             | Amplifier   |      |          |       |
|----------------------------------|-------------|------|----------|-------|
| CHARACTERISTICS:                 | Triode Unit | Pent | ode Unit |       |

#The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.

### **POWER PENTODE**

# 6K6GT

Glass octal type used in output stage of radio receivers and, triode-connected, as a vertical deflection amplifier in television receivers. It is capable of delivering moderate power output with relatively small input

7S

voltage. Tube may be used singly or in push-pull. This type may be supplied with pin No.1 omitted. Tube requires octal socket and may be mounted in any position. Outline 13D, Outlines section. It is especially important that this tube, like other power-handling tubes, be adequately ventilated.

#### THREE-UNIT TRIODE

Duodecar type containing one mediummu and two high-mu triode units used as combined agc, sync, and noise-inverter tube in television receivers employing series-connected heater strings. Outline 8A, Outlines section.

6K11/ 6Q11

250 max 75 max

25 max

7 max

2.2 max megohms

<sup>•</sup> Grid No.2 connected to plate.

<sup>†</sup> The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.

<sup>\*</sup> Under no circumstances should this absolute value be exceeded.

Heater volts (ac/dc), 6.3; amperes, 0.6; warm-up time (average), 11 seconds; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

### HIGH-MU TRIODE— SHARP-CUTOFF PENTODE

6KA8
Related type:
8KA8

Miniature type used in color and  $\kappa$ , is 3 black-and-white television receivers employing series-connected heater  $\epsilon_T$  2 strings. The triode unit is used in sync-separator circuits; the pentode unit has two independent control

grids and is used in gated-agc-amplifier and noise-inverter circuits. Outline 6E, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position. For curves of average plate characteristics for triode unit, refer to type 6AW8A. Type 8KA8 is identical with type 6KA8 except for the heater ratings, as shown below.

| Peak Cathode Current                     | 950 max   | mA    |
| Average Cathode Current                  | 275 max   | mA    |
| Grid-No.2 Input                          | 3.5 max   | watts |
| Plate Dissipation.                       | 20 max    | watts |
| Bulb Temperature (At hottest point)      | 240 max   | °C    |

#### MAXIMUM CIRCUIT VALUES:

Grid-No.1-Circuit Resistance:

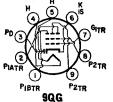

- \*\* The duration of the cycle must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of the horizontal scanning cycle is 10 microseconds.
- † With grid No.3 and grid No.2 connected, respectively, to cathode and plate at socket.
- †† This value can be measured by a method involving a recurrent waveform such that the maximum ratings of the tube will not be exceeded.
- In this service, a positive value may be applied to grid No.3 to minimize snivets" interference; a typical value for this voltage is 30 volts.
- •• An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

### DIODE— THREE-PLATE TETRODE

# **6KM8**

Miniature type used in frequency-divider and complex-wave generator circuits of electronic musical instruments. In such circuits the tetrode unit can provide three independent output-signal voltages; the diode unit

can be used as a key in a vibrato circuit. Outline 6E, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position.

## MEDIUM-MU TRIODE— SHARP-CUTOFF PENTODE

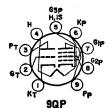

6KR8
Related type:
10KR8

Miniature type used in a wide variety of applications in television receivers. The triode unit is used as a general-purpose amplifier; the pentode unit is used as a video amplifier. Outline 6E, Outlines section. Tube requires minia-

ture nine-contact socket and may be mounted in any position. Type 10KR8 is identical with type 6KR8 except for the heater ratings, as shown below.

| Heater Voltage (ac/dc)                                                                                         | 6.3<br>0.75 | 10.5<br>0.45<br>11 | volts<br>ampere<br>seconds |

### HIGH-MU TRIODE— SHARP-CUTOFF PENTODE

Miniature type used in a variety of applications in television receivers. The pentode unit is used as an if-amplifier tube, and the triode unit as a sync-separator or voltage-amplifier tube. Outline 6B, **Outlines** section.

**6KT8** 

Tube requires miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.6; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode)

#### Class A. Amplifier

### **BEAM POWER TUBE**

Metal type 6L6 and glass octal type 6L6GC are used in the output stage of audio amplifying equipment, especially units designed to have ample reserve of power-delivering ability. These types provide high power output, sen-

6L6 6L6GC

7AC

sitivity, and high efficiency. Power output at all levels has low third- and higherorder harmonics. Type 6L6, Outline 4, type 6L6GC, Outline 19D; Outlines section. Tubes require an octal socket and may be mounted in any position. It is especially important that these tubes, like other power-handling tubes, be adequately ventilated. Type 6L6GC can be used in place of type 6L6 and may be supplied with pin 1 omitted.

### HIGH-MU TRIODE— SHARP-CUTOFF PENTODE

6LC8
Related type:
8LC8

Miniature type used in color and black-and-white television receivers. Pentode unit is used in noise-immune gated-agc-amplifier circuits, and the triode unit in sync-separator circuits. Outline 6E, Outlines section. Tube

requires miniature nine-contact socket and may be mounted in any position. Type 8LC8 is identical with type 6LC8 except for heater ratings, as shown below. For curves of average plate characteristics, refer to type 6KA8.

| Grid-No.3 (Control-Grid) Voltage:                         |                         |         |
| Positive-bias value                                       | 0 max                   | volts   |
| Negative-bias value                                       | 100 max                 | volts   |
| Grid-No.2 (Screen-Grid) Supply Voltage                    | 300 max                 | volts   |
| Grid-No.2 Voltage                                         | See curve page 80       |         |
| Grid-No.1 (Control-Grid) Voltage:                         |                         |         |
| Positive-bias value                                       | 0 max                   | volts   |
| Negative-bias value                                       | -50 max                 | volts   |
| Plate Dissipation                                         | 2 max                   | watts   |
| Grid-No.2 Input:                                          |                         |         |
| For grid-No.2 voltages up to 150 volts                    | 1.1 max                 | watts   |
| For grid-No.2 voltages between 150 and 300 volts          | See curve p             | page 80 |

#### **MAXIMUM CIRCUIT VALUES:**

Grid-No.1-Circuit Resistance:

For fixed-bias operation ... 0.5 max megohm For cathode-bias operation ..... 1 max megohm

The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.

#### TWIN PENTODE

# 6LE8

Miniature type used as combined color demodulator and matrix amplifier in color television receivers utiliz- 63p ing high-level demodulation systems. Outline 6G, Outlines section Tube requires miniature nine-contact socket and may be mounted in any position.

| Heater Voltage (ac/dc)                         | 6.3     | volts      |
|------------------------------------------------|---------|------------|
| Heater Current                                 | 0.76    | ampere     |
| Peak Heater-Cathode Voltage:                   |         |            |
| Heater negative with respect to cathode        | 300 max | volts      |
| Heater positive with respect to cathode        | 200*max | volts      |
| Direct Interelectrode Capacitance (Approx.):   |         |            |
| Plate (Each Unit) to All Other Electrodes      | 3.7     | p <b>F</b> |

### MEDIUM-MU TRIODE— SEMIREMOTE-CUTOFF PENTODE

## **6LM8**

Miniature type used in a wide variety of circuit applications in color and black-and-white television receivers.

The pentode unit is used in burst-amplifier circuits, and the triode unit as a general-purpose amplifier tube.

Outline 6B, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position.

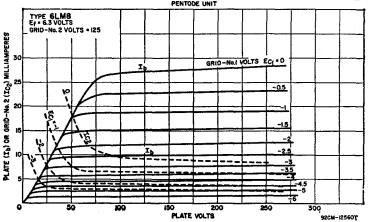

| Heater Voltage (ac/dc)                                        | 6.3       | volts  |
|---------------------------------------------------------------|-----------|--------|
| Heater Current                                                | 0.45      | ampere |
| Peak Heater-Cathode Voltage:                                  |           |        |
| Heater negative with respect to cathode                       | 200 max   | volts  |
| Heater positive with respect to cathode                       | 200 • max | voits  |
| Direct Interelectrode Capacitances:                           |           |        |
| Triode Unit:                                                  |           |        |
| Grid to Plate                                                 | 1.8       | рF     |
| Grid to Cathode, Heater, Pentode Cathode, Pentode Grid No.3,  |           |        |
| and Internal Shield                                           | 3.2       | рF     |
| Plate to Cathode, Heater, Pentode Cathode, Pentode Grid No.3, |           | _      |
| and Internal Shield                                           | 1.9       | pF     |
|                                                               |           | _      |

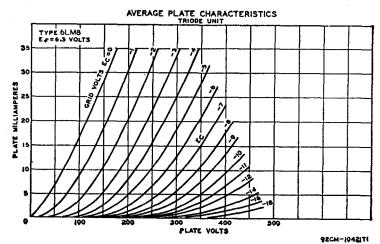

| Pentode Unit: Grid No.1 to Plate                                             | 0.015 max | pF |
|------------------------------------------------------------------------------|-----------|----|
| Internal Shield Plate to Cathode, Heater, Grid No.2, Grid No.3, and Internal | 5.5       | pF |
| Shield                                                                       | 3.8       | pF |
| Heater to Cathode (Each Unit)                                                | 3.2       | рF |
| • The dc component must not exceed 100 volts.                                |           |    |

#### Class A. Amplifier

### MEDIUM-MU TRIODE

**6S4A** 

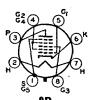

Miniature type having high perveance used as vertical deflection amplifier in television receivers. This type has a controlled heater warm-up time for use in television receivers employing series-connected heater strings. Out-

line 6E, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position.

| may be mounted in any position.                        |           |         |
|--------------------------------------------------------|-----------|---------|

NOTE: The transconductance between grid No.1 and grids No.2 and No.4 connected to plate (not oscillating) is 4500  $\mu$ mhos under the following conditions: grids No.1, No.3 at 0 volts; grids No.2 and No.4 and plate at 100 volts; grid No.5 and shell are connected to cathode at socket.

† The characteristics shown with separate excitation correspond very closely to those obtained in a self-excited oscillator circuit operating with zero bias.

### SHARP-CUTOFF PENTODE

6SJ7
Related type: 12SJ7

Metal type used as rf amplifier and biased detector. As a detector, this type is capable of delivering large audio-frequency output voltage with relatively small input voltage. Outline 2A, Outlines section. Tube requires

8N

octal socket and may be mounted in any position. Type 12SJ7 is identical with type 6SJ7 except for the heater ratings, as shown below.

### HIGH-MU TWIN TRIODE

Glass octal type used as phase inverter in radio equipment. Each unit amplifier circuits. Outline 13D, Outsocket and may be mounted in any lines section. Tube requires octal may also be used in resistance-coupled

6SL7GT

Related type 12SL/GT

position. Except for the common heater, each triode unit is independent of the other. For typical operation as phase inverter or resistance-coupled amplifier, refer to Resistance-Coupled Amplifier section. Type 12SL7GT is identical with type 6SL7GT except for the heater ratings, as shown below.

| # The decade of the college of the c |          |       |

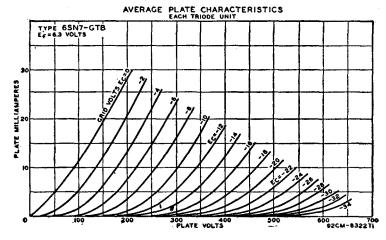

# The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds. Under no circumstances should this absolute value be exceeded.

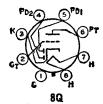

#### MAXIMUM CIRCUIT VALUE:

Grid-Circuit Resistance:

For cathode-bias operation .....

2.2 max megohms

#### TWIN DIODE— HIGH-MU TRIODE

Metal type used as combined detector, amplifier, and avc tube in radio receivers. Outline 2A, Outlines section. Tube requires octal socket and may be mounted in any position. Diodebiasing of the triode unit is not suit-

Related type:

12507

able because of the probability of triode plate-current cutoff even with relatively small signal voltages applied to the diode circuit. Type 12SQ7 is identical with type 6SQ7 except for the heater ratings, as shown below.

| Heater Voltage (ac/dc)                                                          | 6.3    | 12.6   | volts  |

#### **Diode Units**

MAXIMUM RATING (Design-Center Value):

Two diode plates are placed around a cathode, the sleeve of which is common to the triode unit. Each diode plate has its own base pin. For diode operation curves, refer to type 6AV6.

# TRIPLE DIODE-HIGH-MU TRIODE

6T8A
Related type:

Miniature type used as combined audio amplifier, AM detector, and FM detector in AM/FM radio receivers. Diode unit No.1 is used for AM detection, and diode units No.2 and No.3 are used for FM detection. This type

9E

STR A

has a controlled heater warm-up time for use in receivers employing series-connected heater strings. Outline 6B, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position. For typical operation as resistance-coupled amplifier, refer to Resistance-Coupled Amplifier section. Type 5T8 is identical with type 6T8A except for the heater ratings, as shown below.

### BEAM POWER TUBE— SHARP-CUTOFF PENTODE

6T10

Duodecar type used as combined FM detector and audio-frequency output amplifier in television receivers. The beam power unit is used in af output stages, and the sharp-cutoff, dual-control pentode unit is used as an FM

detector. Outline 8B, Outlines section. Tube requires duodecar twelve-contact socket and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.95; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode). For maximum ratings and characteristics, refer to type 6AL11.

### MEDIUM-MU TRIODE— SHARP-CUTOFF PENTODE

6U8A
Related types
5U8, 9U8A

Miniature type used as combined oscillator and mixer tube in television receivers utilizing an intermediate frequency in the order of 40 megacycles per second. This type has a controlled heater warm-up time for use in tele-

vision receivers employing series-controlled heater strings. Outline 6B, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position. Types 5U8 and 9U8A are identical with type 6U8A except for the heater ratings, as shown below.

### THREE-UNIT TRIODE

Duodecar type used in a variety of amplifier applications. Units No.1 and No.3 are medium-mu triode units, and unit No.2 is a high-mu triode unit. Outline 8A, Outlines section. Tube requires duodecar twelve-contact socket

6U10

and may be mounted in any position. Heater volts (ac/dc), 6.3; amperes, 0.6; warm-up time (average), 11 seconds; peak heater-cathode volts, 200 (this value may reach 275 for units No.1 and No.3 when the heater is negative with respect to the cathode; the dc component must not exceed 100 volts).

| For fixed-bias operation                 | 1 max      | 0.5 max | megohm  |
| For cathode-bias operation               | 2.2 max    |         | negohms |
| -                                        |            | ,       |         |

<sup>\*</sup> This value may reach 10 megohms provided the plate-supply voltage and load resistance are such that the plate dissipation can never exceed 0.5 watt.

### HALF-WAVE VACUUM RECTIFIER

6V3A

Miniature type used as a damper tube in horizontal deflection circuits of television receivers. Outline 7B, Outlines section. Tube requires miniature ninecontact socket and may be mounted in any position. It is especially important

9BD

that this tube, like other power-handling tubes, be adequately ventilated. Heater volts (ac/dc), 6.3; amperes, 1.75.

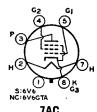

#### **Damper Service**

For operation in a 525-line, 30-frame system

#### MAXIMUM RATINGS (Design-Center Values):

| Peak Inverse Plate Voltage# (Absolute Maximum)              | 6000† max<br>800 max | volts    |
|-------------------------------------------------------------|----------------------|----------|
| Peak Plate Current DC Plate Current                         | 800 max<br>135 max   | mA<br>mA |
| Peak Heater-Cathode Voltage:                                | 133 Hink             | 1112 6   |
| Heater negative with respect to cathode# (Absolute Maximum) | 6750† • max          | volts    |
| Heater positive with respect to cathode                     | 300° max             | volts.   |

- # The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.
- † Under no circumstances should this absolute value be exceeded.
- The dc component must not exceed 750 volts.
- ° The dc component must not exceed 100 volts.

#### **BEAM POWER TUBE**

Metal type 6V6 and glass octal type 6V6GTA are used as output amplifiers in automobile, battery-operated, and other receivers in which reduced plate-current drain is desirable. Outlines 2B and 13D, respectively, **Outlines** sec-

## 6V6 6V6GTA

Related types: 5V6GT, 12V6GT

tion. Tubes require octal socket and may be mounted in any position. These tubes are equivalent in performance to type 6AQ5A. Refer to type 6AQ5A for average plate characteristic curves. Types 5V6GT and 12V6GT are identical with type 6V6GTA except for the heater ratings, as shown below.

<sup>\*</sup> Grid No.2 connected to plate.

† The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.

### **FULL-WAVE VACUUM RECTIFIER**

Miniature type used in power supply of automobile and ac-operated radio receivers. Equivalent in performance to larger type 6X5GT. Type 6X4 requires miniature seven-contact socket and may be mounted in any position.

6X4
Related type:
12X4

Outline 5D, Outlines section. It is especially important that this tube, like other power-handling tubes, be adequately ventilated. For discussion of Rating Chart and Operation Characteristics, refer to Interpretation of Tube Data. Type 12X4 is identical with type 6X4 except for the heater ratings, as shown below.

| Heater Voltage (ac/dc)                                                                                         | 6X4<br>6.3▲        | 12X4<br>12.6       | volts          |
|----------------------------------------------------------------------------------------------------------------|--------------------|--------------------|----------------|
| Heater Current                                                                                                 | 0.6                | 0.3                | ampere         |
| Peak Heater-Cathode Voltage:  Heater negative with respect to cathode  Heater positive with respect to cathode | 450 max<br>200•max | 450 max<br>200•max | volts<br>volts |

A When the heater is operated from a 3-cell (nominal-6-volt) storage-battery source, the permissible heater-voltage range is from 5 to 8 volts.

#### Full-Wave Rectifier

| MAXIMUM KATINGS (Design-maximum values):    |                  |
|---------------------------------------------|------------------|
| Peak Inverse Plate Voltage                  | 1250 max volts   |
| Steady-State Peak Plate Current (Per Plate) | 245 max mA       |
| AC Plate Supply Voltage (Per Plate, rms)    | See Rating Chart |
| DC Output Voltage (At filter input)†        | 350 max voits    |
| DC Output Current (Each plate)†             | 45 max mA        |

<sup>†</sup> This rating applies when the 6X4 is used in vibrator operation with a minimum duty cycle of 75 per cent.

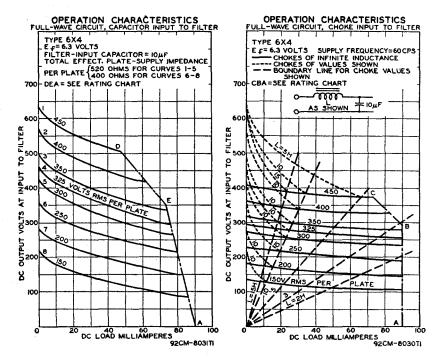

<sup>#</sup> If hot-switching is regularly required in operation, the use of choke-input circuits is recommended. Such circuits limit the hot-switching current to a value no higher than that of the peak plate current. When capacitor-input circuits are used, a maximum peak current value per plate of 1.1 amperes during the initial cycles of the hot-switching transient should not be exceeded.

<sup>·</sup> AC plate supply voltage is measured without load.

Hot-Switching Transient Plate Current .....

<sup>•</sup> The dc component must not exceed 100 volts.

### **FULL-WAVE VACUUM RECTIFIER**

## 6X5GT

Glass octal type used in power supply of automobile and ac-operated receivers. Outline 13D, Outlines section. This type may be supplied with pin No.1 omitted. Tube requires octal socket and may be operated in any position.

68

For maximum ratings, and typical operation, refer to type 6X4.

#### MEDIUM-MU TRIODE— SHARP-CUTOFF PENTOBE

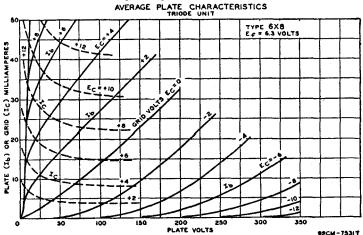

Miniature type used as combined oscillator and mixer tube in television receivers utilizing an intermediate frequency in the order of 40 megacycles per second. In such service, the 6X8 gives performance comparable to that

OAO Related types: 5X8, 19X8

obtainable with a 6AG5 mixer and an oscillator consisting of one unit of a type 6J6. When used in an AM/FM receiver, the triode unit is used as an oscillator for both sections. In the AM section, the pentode unit is used as a high-gain pentode mixer; in the FM section, the pentode unit is used either as a pentode mixer or as a triode-connected mixer depending on signal-to-noise considerations. Outline 6B, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position. Types 5X8 and 19X8 are identical with type 6X8 except for the heater ratings, as shown below.

- The dc component must not exceed 100 volts.
- ▲ With external shield connected to cathode except as noted.
- With external shield connected to pentode plate.

#### Class A, Amplifier

#### **BEAM POWER TUBE**

## 6Y6GA/ 6Y6G

Glass octal type used as output amplifier in radio receivers. Also used in rf-operated, high-voltage power supplies in television equipment. Outline 19B, Outlines section. Tube requires octal socket and may be mounted in any position.

### HIGH-MU TWIN TRIODE

Miniature types used as push-pull cathode-drive amplifiers or frequency converters in the FM and television broadcast bands. Outline 6B, Outlines section. Tubes require miniature nine-contact socket and may be

## 12AT7/ 12AT7/ ECC81

mounted in any position. Each triode unit is independent of the other except for the common heater. For typical operation as a resistance-coupled amplifier, refer to Resistance-Coupled Amplifier section.

## **12AU7A** 12AU7A/ ECC82 Related types:

### MEDIUM-MU TWIN TRIODE

Miniature types used as phase inverters KT2(3 or push-pull amplifiers in ac/dc radio equipment and in diversified applications such as multivibrators or oscillators in industrial control devices. Also used as combined vertical oscil-

12AT77A

Uarizontal

lators and vertical deflection amplifiers, and as horizontal deflection oscillators, in television receivers. These types are also useful in applications critical as to microphonics. Outline 6B, Outlines section. Tubes require miniature nine-contact socket and may be mounted in any position. Each triode unit is independent of the other except for the common heater. For typical operation as a resistance-coupled amplifier, refer to Resistance-Coupled Amplifier section. Types 7AU7 and 9AU7 are identical with types 12AU7A and 12AU7A/ECC82 except for the heater ratings, as shown below.

#### MAXIMUM CIRCUIT VALUE:

Grid-Circuit Resistance:

For cathode-bias operation .....

2.2 max megohms

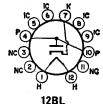

# The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds.

\* Under no circumstances should this absolute value be exceeded.

### HALF-WAVE VACUUM RECTIFIER

# 12BT3

Duodecar type used as damper tube in horizontal-deflection circuits of television receivers. Outline 8C, Outlines section. Tube requires duodecar twelve-contact socket and may be mounted in any position. Heater volts (ac/dc), 12.6; amperes, 0.45.

#### **Damper Service**

For operation in a 525-line, 30-frame system

Tube Voltage Drop for plate current of 250 mA max .....

| Peak Inverse Plate Voltage#             | 3300 max | volts |
|-----------------------------------------|----------|-------|
| Peak Plate Current                      | 1000 max | mA    |
| DC Plate Current                        | 165 max  | mA    |
| Plate Dissipation                       | 5.3 max  | watts |
| Peak Heater-Cathode Voltage:            |          |       |
| Heater negative with respect to cathode | 3300 max | volts |
| Heater positive with respect to cathode | 300=max  | volts |
| CHADACTEDISTICS Instantaneous Value     |          |       |

#### ACTERISTICS, Instantaneous Value:

# The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning

- cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.
- The dc component must not exceed 600 volts.
- The dc component must not exceed 100 volts.

### SHARP-CUTOFF PENTODE

# **12BY7A**

Miniature type used as video amplifier in television receivers. This type has a controlled heater warm-up time for use in series-connected heater strings. Outline 6E, Outlines section. Tubes require miniature nine-contact socket and may be mounted in any position.

For fixed-bias operation ......

For cathode-bias operation .....

### HIGH-MU TWIN TRIODE

12BZ7

Miniature type used in sync-separator KT2(3 and sync-amplifier circuits of television receivers. This tube is also used GT (2) in clipping circuits and in generalpurpose audio amplifier applications. Outline 6E, Outlines section. Tube re-

quires miniature nine-contact socket and may be mounted in any position. Heater volts (ac/dc), 12.6 (series), 6.3 (parallel); amperes, 0.3 (series), 0.6 (parallel); peak heater-cathode volts, 180.

### Class A, Amplifier (Each Unit)

| MAXIMUM RATINGS (Design-Center Values): |         |         |
|-----------------------------------------|---------|---------|
| Plate Voltage                           | 300 max | volts   |
| Grid Voltage:                           |         |         |
| Negative-bias value                     | -50 max | volts   |
| Positive-bias value                     | 0 max   | volts   |
| Plate Dissipation                       | 1.5 max | watts   |
| CHARACTERISTICS:                        |         |         |
| Plate Voltage                           | 250     | volts   |
| Grid Voltage                            | —2      | volts   |
| Amplification Factor                    | 100     |         |
| Plate Resistance (Approx.)              | 31800   | ohms    |
| Transconductance                        | 3200    | μmhos   |
| Plate Current                           | 2.5     | mA      |
| MAXIMUM CIRCUIT VALUE:                  |         |         |
| Grid-Circuit Resistance:                |         |         |
| For contact-potential-bias operation    | 5 max r | megohms |

HALF-WAVE VACUUM RECTIFIER

12D4

Glass octal type used as damper diode in horizontal-deflection circuits of television receivers employing seriesconnected heater strings. Outline 13D, Outlines section. Tube requires octal socket and may be mounted in any

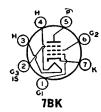

position. Socket terminals 1, 2, 4, and 6 should not be used as tie points. This type may be supplied with pin 1 omitted. It is especially important that this tube, like other power-handling tubes, be adequately ventilated. Heater volts (ac/dc), 12.6; amperes, 0.6; warm-up time (average), 11 seconds.

### **Damper Service**

| For operation in a 525-line, 30-trame system |                   |       |
|----------------------------------------------|-------------------|-------|
| MAXIMUM RATINGS (Design-Maximum Values):     |                   |       |
| Peak Inverse Plate Voltage#                  | 4400 max          | volts |
| Peak Plate Current                           | 900 max           | mA    |
| DC Plate Current                             | 155 max           | mA    |
| Plate Dissipation                            | 5.5 max           | watts |
| Peak Heater-Cathode Voltage:                 |                   | _     |
| Heater negative with respect to cathode#     | 4400 <b>≜</b> max | volts |
| Heater positive with respect to cathode      | 300 = max         | volts |

- #The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds. The dc component must not exceed 900 volts.
- The dc component must not exceed 100 volts.

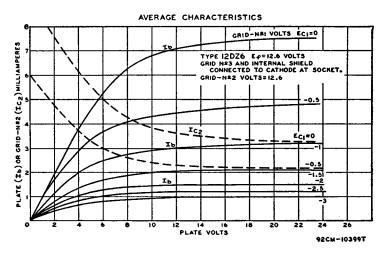

### **REMOTE-CUTOFF PENTODE**

Miniature type used as rf and if amplifier in low B+ voltage automobile radio receivers operating directly from 12-volt storage-battery systems. Outline 5C, Outlines section. Tube requires miniature seven-contact socket and may be mounted in any position.

12DZ6

### MEDIUM-MU TRIODE— PENTAGRID CONVERTER

# **12FX8A**

Miniature type used as combined rf amplifier and frequency converter in low B+ voltage automobile radio receivers operating directly from 12-volt storage-battery systems. Outline 6D, Outlines section. Tube requires minia-

ture nine-contact socket and may be operated in any position. Heater-voltage range (dc), 10 to 15.9; amperes at 12.6 volts, 0.27; peak heater-cathode volts, 16.

#### **Heptode Unit as Converter**

Plate Current (Each Unit) ......

### DIODE

Miniature types used as booster diodes in line-time-base circuits of transformerless television receivers. Outline, 7D, Outlines section. Tubes require miniature nine-contact socket and may

5 max

mΑ

be mounted in any position. Heater volts (ac/dc), 16.4; amperes, 0.6; peak heatercathode volts, 6600 (the pulse duration must not exceed 22 per cent of a cycle, or a maximum of 18 microseconds).

| MAXIMUM RATINGS (Design-Center Values): |                             |       |
|-----------------------------------------|-----------------------------|-------|
| Supply Voltage at zero current          | 550 max                     | volts |
| Supply Voltage                          | 250 max                     | volts |
| Peak Plate Current                      |                             | mΑ    |
| Average Plate Current                   | <ul> <li>220 max</li> </ul> | mA    |
| Plate Dissipation                       | 5 max                       | watts |
| Peak Negative-Pulse Plate Voltage       | —6000∙max                   | volts |

- Under no conditions should an absolute maximum value of 7500 volts be exceeded.
- The pulse duration must not exceed 22 per cent of a cycle, or a maximum of 18 microseconds.

### HIGH-MU TWIN TRIODE

# 17EW8

Miniature type used in rf-amplifier and oscillator-mixer circuits in FM and AM radio receivers. Outline 6B, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position. Heater volts,

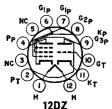

17.5; amperes, 0.15; peak heater-cathode volts, 90.

#### **MAXIMUM CIRCUIT VALUES:**

\* Should not be used if grid current is not permissible.

### MEDIUM-MU TRIODE— POWER PENTODE

Duodecar type used as combined vertical-deflection-oscillator and verticaldeflection-amplifier tube in television receivers employing series-connected heater strings Outline 8B, Outlines section. Tube requires duodecar twelve-

17JZ8

contact socket and may be mounted in any postion. Heater volts (ac/dc), 16.8; amperes, 0.45; warm-up time (average), 11 seconds; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

### Class A, Amplifier

| CHARACTERISTICS:                                        | Triode<br>Unit | Pentode<br>Unit |       |

<sup>#</sup>The duration of the voltage pulse must not exceed 15 per cent of one vertical scanning cycle. In a 525-line, 30-frame system, 15 per cent of one vertical scanning cycle is 2.5 milliseconds. † An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

### REMOTE-CUTOFF PENTODE

# **18FW6A**

Miniature type used as rf- and ifamplifier tube in ac/dc radio receivers. Outline 5C, **Outlines** section. Tube requires miniature seven-contact socket and may be mounted in any position.

7CC

Heater volts (ac/dc), 18; amperes, 0.1;

warm-up time (average), 20 seconds; peak heater-cathode volts, 100.

### HALF-WAVE VACUUM RECTIFIER

# 19AU4

Glass octal type used as damper diode in horizontal-deflection circuits of black-and-white television receivers employing series-connected heater strings. Outline 13G, Outlines section. Tube requires octal socket and may

4CG

be mounted in any position. This type may be supplied with pin 1 omitted. Socket terminals 1, 2, 4, and 6 should not be used as tie points. It is especially important that this tube, like other power-handling tubes, be adequately ventilated. Heater volts (ac/dc), 18.9; amperes, 0.6; warm-up time (average), 11 seconds.

#### **Damper Service**

For operation in a 525-line, 30-frame system

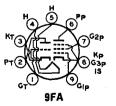

| MAXIMUM RATINGS (Design-Center Values): |           |       |
|-----------------------------------------|-----------|-------|
| Peak Inverse Plate Voltage#             | 4500°max  | volts |
| Peak Plate Current                      | 1050 max  | mA    |
| DC Plate Current                        | 175 max   | mA    |
| Plate Dissipation                       | 6 max     | watts |
| Peak Heater-Cathode Voltage:            |           |       |
| Heater negative with respect to cathode | 4500°†max | volts |
| Heater positive with respect to cathode | 300≜max   | volts |

- # The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal cycle is 10 microseconds.
- Onder no circumstances should this absolute value be exceeded.
- † The dc component must not exceed 900 volts.
- A The dc component must not exceed 100 volts.

### HIGH-MU TRIODE SHARP-CUTOFF PENTODE

# 19HV8

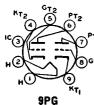

Miniature type used as if-amplifier and af voltage-amplifier tube in radio receivers employing series-connected heater strings. Outline 6B, Outlines section. Tube requires miniature nine-contact socket and may be mounted

in any position. Heater volts (ac/dc), 18.9; amperes, 0.15; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

### Class A, Amplifier

#### **MAXIMUM CIRCUIT VALUES:**

<sup>†</sup> This value can be measured by a method involving a recurrent waveform such that the maximum ratings of the tube will not be exceeded.

<sup>††</sup> Triode connection (grid No.2 tied to plate).

<sup>•</sup> In a horizontal-deflection-amplifier service, a positive voltage (typical value, 50 volts) may be applied to grid No.3 to reduce "snivets" interference, which may occur in both vhf and uhf television receivers.

<sup>••</sup> An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

### **BEAM POWER TUBE**

# **22JU6**

Novar type used as horizontal deflection amplifier in low-B+ black-and-white television receivers employing series-connected heater strings. Outline 18A, Outlines section. Tube requires novar nine-contact socket and may be mounted in any position.

#### **MAXIMUM CIRCUIT VALUE:**

Grid-No.1-Circuit Resistance:
For grid-No.1-resistor-bias operation

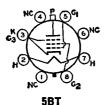

# The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle.

- # The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.
- ^ In this service, a positive voltage may be applied to grid No.3 to minimize "snivets" interference; a typical value for this voltage is 30 volts.
- † An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

Refer to type 25BO6GTB/25CU6.

**25CU6** 

2.2 max megohms

### **BEAM POWER TUBE**

Glass octal type used as horizontaldeflection amplifier in television receivers employing series-connected heater strings. Outline 21B, Outlines section. Tube requires octal socket. Vertical tube mounting is preferred

**25DN6** 

but horizontal operation is permissible if pins 1 and 3 are in vertical plane.

| Plate Dissipation†                                    | 15 max    | watts         |
| Bulb Temperature (At hottest point)                   | 225 max   | °C            |
|                                                       |           |               |

#### MAXIMUM CIRCUIT VALUE:

Grid-No.1-Circuit Resistance .....

0.47 max megohm

- # The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds. 

  Under no circumstances should this absolute value be exceeded.
- † An adequate bias resistor or other means is required to protect the tube in the absence of excitation,

### BEAM POWER TUBE

# 25F5A

Miniature type used in audio-output stage of ac/dc radio receivers employing series-connected heater strings. Outline 5D, Outlines section. Tube requires miniature seven-contact socket and may be mounted in any position.

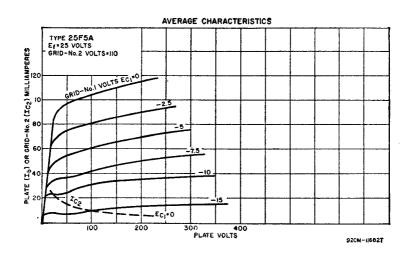

| and may be mounted in any position.                    | 7CV     |         |
|--------------------------------------------------------|---------|---------|
| Heater Voltage (ac/dc)                                 | 25      | volts   |
| Heater Current                                         | 0.15    | ampere  |
| Heater Warm-up Time (Average)                          | 17      | seconds |
| Peak Heater-Cathode Voltage:                           |         |         |
| Heater negative with respect to cathode                | 200 max | volts   |
| Heater positive with respect to cathode                | 200=max | volts   |
| Direct Interelectrode Capacitances (Approx.):          |         |         |
| Grid No.1 to Plate                                     | 0.44    | рF      |
| Grid No.1 to Cathode, Heater, Grid No.2, and Grid No.3 | 12      | pF      |
| Plate to Cathode, Heater, Grid No.2, and Grid No.3     | 8       | pF      |
| ■ The dc component must not exceed 100 volts.          |         |         |
| Class A Amnlifier                                      |         |         |

#### Class A<sub>1</sub> Amplifier

### **POWER PENTODE**

# **32ET5A**

Miniature type used in audio output stage of compact ac/dc radio receivers. Outline 5D, Outlines section. Tube requires miniature seven-contact socket and may be mounted in any position. Heater volts (ac/dc), 32; amperes, 0.1;

7CV

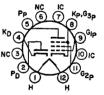

warm-up time (average), 20 seconds; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

### DIODE-BEAM POWER TUBE

# 33GT7

Duodecar type used in a wide variety of applications in television receivers. The diode unit is used for damper service and the beam power unit for horizontal-deflection amplifier service. Outline 15A, Outlines section. Tube

12FC

requires duodecar twelve-contact socket and may be mounted in any position.

| Heater Voltage (ac/dc)                                 | 33.6    | volts   |
|--------------------------------------------------------|---------|---------|
| Heater Current                                         | 0.45    | ampere  |
| Heater Warm-up Time (Average)                          | 11      | seconds |
| Peak Heater-Cathode Voltage:                           |         |         |
| Heater negative with respect to cathode                | 200 max | volts   |
| Heater positive with respect to cathode                | 200*max | volts   |
| Direct Interelectrode Capacitances (Approx.):          |         |         |
| Diode Unit:                                            |         |         |
| Plate to Cathode and Heater                            | 5.5     | pF      |
| Cathode to Plate and Heater                            | 8.5     | pF      |

| Plate Voltage                                | 400 max  | volts |
| Peak Positive-Pulse Plate Voltage††          | 3500 max | volts |
| Peak Negative-Pulse Plate Voltage            | 0 max    | volts |
| Grid-No.2 Voltage                            | 150 max  | volts |
| DC Grid-No.1 DC Voltage, Negative-bias value | —55 max  | volts |
| Peak Negative-Pulse Grid-No.1 Voltage        | —330 max | volts |
| Average Cathode Current                      | 140 max  | mA    |
| Peak Cathode Current                         | 490 max  | mA    |
| Plate Dissipation.                           | 9 max    | watts |
| Grid-No.2 Input                              | 2.5 max  | watts |

#### **MAXIMUM CIRCUIT VALUES:**

Grid-No.1-Circuit Resistance ......

1 max megohm

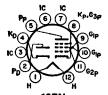

#### Damper Service—Diode Unit

For operation in a 525-line, 30-frame system

| MAXIMUM RATINGS (Design-Maximum Values):      |          |       |
|-----------------------------------------------|----------|-------|
| Peak Inverse Plate Voltage††                  | 2500 max | volts |
| Peak Plate Current                            | 750 max  | mA    |
| DC Plate Current                              | 125 max  | mA    |
| Plate Dissipation                             | 3.5 max  | watts |
| Peak Heater-Cathode Voltage:                  |          |       |
| Heater negative with respect to cathode       | 2500□max | volts |
| Heater positive with respect to cathode       | 200□□max | volts |
| Bulb Temperature (at hottest point)           | 220 max  | °C    |
| CHARACTERISTICS, Instantaneous Value:         |          |       |
| Tube Voltage Drop for plate current of 250 mA | 21       | volts |

<sup>††</sup> The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.

DD The dc component must not exceed 100 volts.

#### DIODE—BEAM POWER TUBE

Duodecar type used as combined damper diode and horizontal deflection amplifier in televison receivers employing series-connected heater strings. Outline 15A, Outlines section. Tube requires duodecar twelve-contact sock-

33**GY**7

et and may be mounted in any position. Heater volts (ac/dc), 33.6; amperes, 0.45; warm-up time (average), 11 seconds.

<sup>•</sup> An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

<sup>□</sup> The dc component must not exceed 400 volts.

#### Beam Power Unit as Class A. Amplifier

| Grid-No.1 Voltage (Approx.) for plate current                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |      |      |       |       |
| of 1 mA                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 80   |      | 40    | volts |

Grid No.2 tied to plate.

#### Beam Power Unit as Horizontal-Deflection Amplifier

For operation in a 525-line, 30-frame system

| MAXIMUM RATINGS (Design-Maximum Values): | Power Beam Un | it    |
|------------------------------------------|---------------|-------|
| DC Plate Supply Voltage                  | 400 max       | volts |
| Peak Positive-Pulse Plate Voltage#       | 5000 max      | volts |
| Peak Negative-Pulse Plate Voltage        | 0 max         | volts |
| DC Grid-No.2 Voltage                     | 150 max       | volts |
| DC Grid-No.1 Voltage                     | 55 max        | volts |
| Peak Negative-Pulse Grid-No.1 Voltage    | -330 max      | volts |
| Peak Cathode Current                     | 540 max       | mA    |
| Average Cathode Current                  | 155 max       | mA    |
| Plate Dissipation†                       | 9 max         | watts |
| Grid-No.2 Input                          | 3 max         | watts |
| Peak Heater-Cathode Voltage:             |               |       |
| Heater negative with respect to cathode  | 200 max       | volts |
| Heater positive with respect to cathode  | 200 • max     | volts |

#### **MAXIMUM CIRCUIT VALUE:**

Grid-No.1-Circuit Resistance .....

1 max megohm

21

volts

#### Damper Service (Diode Unit)

For operation in a 525-line, 30-frame system

| MAXIMUM RATINGS (Design-Maximum Values): | Diode Unit |       |
|------------------------------------------|------------|-------|
| Peak Inverse Plate Voltage#              | 4200 max   | volts |
| Peak Plate Current                       | 810 max    | mA    |
| DC Plate Current                         | 135 max    | mA    |
| Plate Dissipation                        | 3.8 max    | watts |
| Peak Heater-Cathode Voltages:            |            |       |
| Heater negative with respect to cathode  | 4200≜max   | volts |
| Heater positive with respect to cathode  | 200 • max  | volts |
| Bulb Temperature (At hottest point)      | 200 max    | •c    |
| CHARACTERISTICS, Instantaneous Value:    |            |       |

Tube Voltage Drop for plate current of 250 mA .....

# The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle.

<sup>-</sup> This value can be measured by a method involving a recurrent waveform such that the maximum ratings of the tube will not be exceeded.

<sup>#</sup> The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.

<sup>†</sup> An adequate bias resistor or other means is required to protect the tube in the absence of excitation.

<sup>•</sup> The dc component must not exceed 100 volts.

In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.

<sup>▲</sup> The dc component must not exceed 400 volts.

<sup>•</sup> The dc component must not exceed 100 volts.

### **BEAM POWER TUBE**

Duodecar type used as horizontal-© 63 deflection amplifier in television receivers. Outline 15B, Outlines section. Tube requires duodecar twelve-contact socket and may be mounted in any position. Heater volts (ac/dc), 33; am-

33JV6

peres, 0.3; average warm-up time, 11 seconds; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

### Class A<sub>1</sub> Amplifier

### **BEAM POWER TUBE**

Miniature type used in output stage of compact, ac/dc radio receivers. Because of its high power sensitivity and high efficiency at plate and screen-grid voltages available in ac/dc receivers, the 35C5 is capable of providing a

35C5

7CV

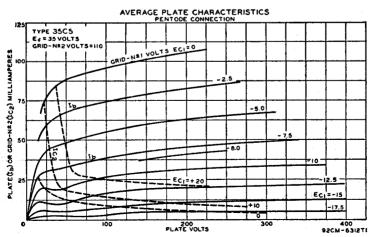

relatively high power output. Except for terminal connections and slightly higher ratings, type 35C5 is equivalent in performance to miniature type 35B5 and, within its maximum ratings, to glass octal type 35L6GT. The basing arrangement of the 35C5 simplifies the problem of meeting Underwriters' Laboratories requirements in the design of ac/dc receivers.

| Heater Voltage (ac/dc)                                 | 35      | volts  |
|--------------------------------------------------------|---------|--------|

#### Installation and Application

Type 35C5 requires miniature seven-contact socket and may be mounted in any position. Outline 5D, Outlines section. It is especially important that this tube, like other power-handling tubes, should be adequately ventilated.

The 35-volt heater is designed to operate under the normal conditions of line-voltage variation without materially affecting the performance or serviceability of the 35C5. For operation of the 35C5 in series with other types having 0.15-ampere rating, the current in the heater circuit should be adjusted to 0.15 ampere for the normal supply voltage.

In a series-heater circuit of the "dc-power line" type employing several 0.15-ampere types and one or two 35C5s, the heater(s) of the 35C5(s) should be placed on the positive side of the line. Under these conditions, heater-cathode voltage of the 35C5 must not exceed the value given under maximum ratings. In a series-heater circuit of the "universal" type employing rectifier tube 35W4, one or two 35C5s and several 0.15-ampere types, it is recommended that the heater(s) of the 35C5(s) be placed in the circuit so that the higher values of heater-cathode bias will be impressed on the 35C5(s) rather than on the other 0.15-ampere types. This is accomplished by arranging the 35C5(s) on the side of the supply line which is connected to the cathode of the rectifier, i.e., the positive terminal of the rectified voltage supply. Between this side of the line and the 35C5(s), any necessary auxiliary resistance and the heater of the 35W4 are connected in series.

As a power amplifier (class A<sub>1</sub>), the 35C5 is recommended for use either singly or in push-pull combination in the power-output stage of ac/dc receivers. The operating values shown under typical operation have been determined on the basis that grid-No.1 current does not flow during any part of the input cycle.

### **POWER PENTODE**

# 35EH5

any position.

Miniature type used in the audio output stage of radio and television receivers and in phonographs. This type has unusually high power sensitivity and is capable of providing relatively high power output at low plate and 10 0°2 c,2 70 70,

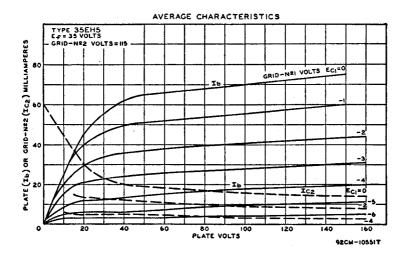

screen-grid voltages with a low af grid-No.1 driving voltage. Outline 5D, Outlines section. Tube requires miniature seven-contact socket and may be mounted in

When Panel Lamp Fails .....

### Installation and Application

Tube requires miniature seven-contact socket and may be mounted in any position. Outline 5D, Outlines section. For heater considerations, refer to miniature type 35C5.

With the panel lamp connected as shown in the diagram, the drop across R and all heaters (with panel lamp) should equal 117 volts at 0.15 ampere. The shunting resistor R, is required when dc output current exceeds 60 milliamperes. Values of R<sub>8</sub> for dc output currents greater than 60 milliamperes are given in tabulated data.

<sup>•</sup> Required when dc output current is greater than 60 milliamperes.

### HALF-WAVE VACUUM RECTIFIER

# **36AM3B**

Miniature type used in power supply of ac/dc receivers. This type has a tapped heater so that the heater section between pins 4 and 6 can be used as a limiting resistance in the rectifier plate circuit. This heater section is not to be

5BQ

used as a panel-lamp shunt. Outline 5D, **Outlines** section. Tube requires miniature seven-contact socket and may be operated in any position.

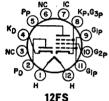

| Heater Voltage (ac/gc):       |     |               |
|-------------------------------|-----|---------------|
| Entire Heater (Pins 3 and 4)  | 36  | volt <b>s</b> |
| Tap Section (Pins 3 and 6)    | 32  | volts         |
| Heater Current (Pins 3 and 6) | 0.1 | · ampere      |
| Heater Warm-up Time (Average) | 20  | seconds       |

| Peak Heater-Cathode Voltage:  Heater negative with respect to cathode  Heater positive with respect to cathode | -350∙max<br>200∗max | volts<br>volts |
|----------------------------------------------------------------------------------------------------------------|---------------------|----------------|
| • The dc component must not exceed 350 volts.                                                                  |                     |                |

• The dc component must not exceed 100 volts.

CHARACTERISTICS (Instantaneous Value):

†† The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds.

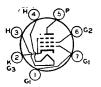

☐ The dc component must not exceed 500 volts.

DD The dc component must not exceed 100 volts.

#### **BEAM POWER TUBE**

50**B**5

Miniature type used in output stage of compact ac/dc receivers. Because of its high power sensitivity at plate and screen-grid voltages available in ac/dc receivers, it is capable of providing a relatively high power output. Outline

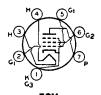

7BZ

5D, Outlines section. Tube requires miniature seven-contact socket and may be mounted in any position. Except for basing arrangement, type 50B5 is identical with miniature type 50C5.

#### **BEAM POWER TUBE**

50C5 Related types: 17C5, 25C5 Miniature type used in output stage of compact, ac/dc radio receivers. Because of its high power sensitivity and high efficiency at plate and screengrid voltages available in ac/dc receivers, the 50C5 is capable of provid-

7CV

ing a relatively high power output. Within its maximum ratings, type 50C5 is

### **Installation and Application**

Type 50C5 requires miniature seven-contact socket and may be mounted in any position. Outline 5D, **Outlines** section. It is especially important that this tube, like other power-handling tubes, be adequately ventilated.

The 50-volt heater is designed to operate under the normal conditions of line-voltage variation without materially affecting the performance or serviceability of the 50C5. For operation of the 50C5 in series with other types having 0.15-ampere rating, the current in the heater circuit should be adjusted to 0.15 ampere for the normal supply voltage.

In a series-heater circuit of the "dc power line" type employing several 0.15-ampere types and one or two 50C5s, the heater (s) of the 50C5(s) should be placed on the positive side of the line. Under these conditions, heater-cathode voltage of the 50C5 must not exceed the value given under maximum ratings. In a series-heater circuit of the "universal" type employing rectifier tube 35W4, one or two 50C5s, and several 0.15-ampere types, it is recommended that the heater(s) of the 50C5(s) be placed in the circuit so that the higher values of heater-cathode bias will be impressed on the 50C5(s) rather than on the other 0.15-ampere types. This is accomplished by arranging the 50C5(s) on the side of the supply line which is connected to the cathode of the rectifier, i.e., the positive terminal of the rectified voltage supply. Between this side of the line and the 50C5(s), any necessary auxiliary resistance and the heater of the 35W4 are connected in series.

As a power amplifier (class A<sub>1</sub>), the 50C5 is recommended for use either singly or in push-pull combination in the power-output stage of "ac/dc" receivers. The operating values shown under typical operation have been determined on the basis that grid-No.1 current does not flow during any part of the input cycle.

# HALF-WAVE VACUUM RECTIFIER

<sup>†</sup> No.40 or No.47 panel lamp used in circuit with capacitor-input filter given under type 35W4.

• Required when de output current is greater than 70 milliamperers.

### **POWER PENTODE**

Miniature type used in the audiofrequency power output of radio receivers. Heater is provided with a tap for operation of a panel lamp. Outline 5D, Outlines section. Tube requires miniature seven-contact socket and

50HC6

| may be mounted in any position.                                       |         |            |

# POWER PENTODE

# 50HK6

Miniature type used in audio-frequency power-output stage of radio receivers. Outline 5D, Outlines section. Tube requires miniature seven-contact socket and may be mounted in any position. The heater is provided with a tap for

7FZ

operation of a panel lamp. Heater volts (ac/dc), 50; amperes, 0.15; tap volts (without panel lamp), 7; peak heater-cathode volts, 200 (the dc component must not exceed 100 volts when the heater is positive with respect to the cathode).

### Class A, Amplifier

| MAXIMUM RATINGS (Design-Maximum Values):     |       |     |          |

### SHARP-CUTOFF PENTODE

Miniature type used as audio amplifier in applications requiring reduced microphonics, leakage noise, and hum. Especially useful in the input stages of medium-gain public-address systems, home sound recorders, and general-

5879

purpose audio systems. Outline 6B, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position. For operation as resistance-coupled amplifier, refer to Resistance-Coupled Amplifier section.

<sup>•</sup> Grid No.2 connected to plate.

# **BEAM POWER TUBE**

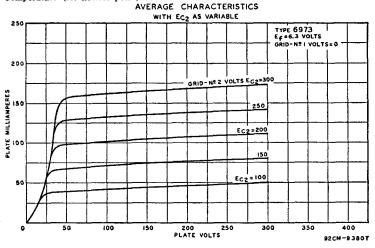

Miniature type used as power amplifier in compact high-fidelity audio equipment. Tube features linear operation over a wide range of power, high power sensitivity, high stability, and low heater power, and is capable of

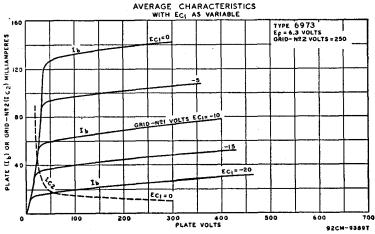

6973

delivering high power output at low distortion. Double base-pin connections for both grid No.1 and grid No.2 provide cool operation of grids and thus minimize grid emission and permit use of high values of grid-circuit resistance to reduce driving power. Outline 6G, Outlines section. Tube requires miniature nine-contact socket and may be mounted in any position.

- \* Obtained from taps on the primary winding of the output transformer. The taps are located on each side of the center tap (B+) so as to apply 50 per cent of the plate signal voltage to grid No.2 of each output tube.
- # Obtained from taps on the primary winding of the output transformer. The taps are located on each side of the center tap (B+) so as to supply 43 per cent of the plate signal voltage to grid No.2 of each output tube.
- The type of input-coupling network used should not introduce too much resistance in the grid-No.1 circuit. Transformer- or impedance-coupling devices are recommended.

### HIGH-MU TWIN TRIODE

Miniature type used as phase inverter or resistance-coupled amplifier in high-quality, high-fidelity audio amplifiers where low noise and hum are primary considerations. Outline 6B, Outlines section. This type is identical with

7025

miniature type 12AX7A except that it has a controlled equivalent noise and hum characteristic. For operation as resistance-coupled amplifier, refer to Resistance-Coupled Amplifier section.

# EQUIVALENT-NOISE AND HUM VOLTAGE

REFERENCE TO GRID (Each Unit):

| test site to ditte (such ont). |     |         |
|--------------------------------|-----|---------|
| Average Value (rms)†           | 1.8 | $\mu V$ |
| Maximum Value (rms).           | 7   | $\mu V$ |

- † Measured in "true rms" units under following conditions: heater volts (ac), 6.3 (parallel connection); center tap of heater transformer connected to ground; plate supply volts, 250; plate load resistor, 2700 ohms; cathode-bypass capacitor, 100  $\mu$ F; grid resistor, 0 ohms; and amplifier covering frequency range between 25 to 10000 cycles per second.
- Same conditions as for "Average Value" except: cathode resistor is unbypassed and grid resistor, 0.05 megohm.

### **BEAM POWER TUBE**

# 7027A

Glass octal type used in push-pull power amplifier circuits of high-fidelity audio equipment. Tube provides high power sensitivity and high stability and is capable of delivering high power output at low distortion. Double base-

8HY

pin connections for both grid No.1 and grid No.2 provide for flexibility of circuit arrangement and also cool operation of the grids with the result that reverse grid current is minimized. Outline 19F, Outlines section. Tube requires octal socket and may be mounted in any position. It is especially important that this tube, like other power-handling tubes, be adequately ventilated.

#### MAXIMUM CIRCUIT VALUES:

Grid-No.1-Circuit Resistance:

For fixed-bias operation O.1 max megohm
For cathode-bias operation O.5 max megohm

• The type of input coupling network used should not introduce too much resistance in the grid-No.1 circuit. Transformer- or impedance-coupling devices are recommended.

### Push-Pull Class AB, Amplifier

Grid No.2 of Each Tube Connected to Tap on Plate Winding of Output Transformer MAXIMUM RATINGS (Design-Maximum Values):
