Amateur
Transmitting Manual

In addition to the "T" line products shown on pages 61, 62 and 63 of this manual the Kenyon Transformer Co., Inc., also manufacture a complete line of Laboratory Standard, Portable, Silver and Replacement units.

Facilities are available to manufacture transformers and reactors up to 50 KVA.

If interested in special broadcast or power apparatus you are cordially invited to consult our technical and research staff.

The Amateur's Code

I

The Amateur is Gentlemanly. He never knowingly uses the air for his own amusement in such a way as to lessen the pleasure of others. He abides by the pledges given by the A.R.R.L. in his behalf to the public and the Government.

II

The Amateur is Loyal. He owes his amateur radio to the American Radio Relay League, and he offers it his unswerving loyalty.

III

The Amateur is Progressive. He keeps his station abreast of science. It is built well and efficiently. His operating practice is clean and regular.

IV

The Amateur is Friendly. Slow and patient sending when requested, friendly advice and counsel to the beginner, kindly assistance and coöperation for the broadcast listener; these are marks of the amateur spirit.

V

The Amateur is Balanced. Radio is his hobby. He never allows it to interfere with any of the duties he owes to his home, his job, his school, or his community.

VI

The Amateur is Patriotic. His knowledge and his station are always ready for the service of his country and his community.

PREFACE

THIS manual has been prepared to serve a real and growing need among the amateur fraternity for a more practical transmitter manual than has heretofore been offered by existing publications.

On the following pages will be found what is probably the most carefully selected and comprehensive group of transmitting circuits ever compiled in a single book.

The various circuits were selected from among the most popular in use by thousands of amateurs all over the world. Every design shown herein is a thoroughly tested and proven circuit. While many of the circuits are comparatively new, the dependable "sure fire" circuits have also been included because for dollar value they cannot be surpassed even with the new crop of transmitting tubes.

Although some of the fundamental designs have appeared in other publications, a few modifications are included in the majority of these circuits which have resulted in greater efficiency without raising the cost of the components. By far the most prominent improvement is the use of the new triple winding plate transformer. This recent development by our laboratory staff not only improves voltage regulation but lowers the cost of the most expensive unit in the transmitter, namely—the power supply.

Another noteworthy innovation is the inclusion of fixed bias wherever possible without increasing the cost. This eliminates one of the most outstanding difficulties encountered in amateur radio. While many use batteries for this service, a careful check has shown that due to the back EMF from the various transmitter circuits, batteries have a somewhat varying voltage and a comparatively short life. However, the inclusion of fixed bias entirely eliminates this evil.

In the preparation of the text, theoretical discussions have been given little space as this is amply covered in existing "Handbooks" without which no station is complete. However, the pages devoted to graphical solutions of the many and varied problems are included with the realization that every amateur is not an electrical engineer.

The author desires to acknowledge his indebtedness to A.R.R.L., All Wave Radio and Radio News for loan of cuts and material used in the preparation of the manuscript. Grateful acknowledgment is also due to the large number of amateurs who offered their opinions and criticisms of the material needed to make this manual what the amateur wants.
It is fully realized that a book of this nature cannot hope to satisfy the entire amateur fraternity as many no doubt have their own ideas as to what constitutes a transmitting manual. We will therefore greatly appreciate criticisms of any sort including new material or new ideas of general interest which will permit a revision of this manual.

—J. B. C.

XMITTER ◆ MANUAL

INDEX

R-F OPERATION OF SCREEN-GRID TUBES

Notes on the Application of Tetrodes and Pentodes to Amateur Transmitters.

Screen-grid tubes are old in amateur practice as anyone who made use of the 865 at its introduction will testify. The general use of the screen-grid tube in the amateur transmitter did not become common, however, until the advantages of the 47 as a crystal oscillator were discovered, and the greatest step of all came with the introduction of suppressor-grid modulation to American amateurs by James Lamb in the early part of 1934. The tritet oscillator using a 59 had the advantages of a pentode screen-grid tube such as the 59. This had already been made known by Lamb and are important steps in the history of amateur transmitter development. Screen grid tubes of both the tetrode and pentode types were in common use in Europe before their introduction here and suppressor-grid modulation was first introduced there. The application of the tubes and this type of modulation to amateur radio can be credited to amateurs on this continent.

Tetrode tubes differ from triode types in that a grid known as a screen is inserted in the tube structure between the control grid and the plate. This grid, of relatively fine pitch in tubes used solely for R-F amplification, is normally by-passed to the filament or cathode so that the screen circuit contains no R-F impedance. Under these conditions the screen is an efficient electrostatic shield between the grid and plate

Fig. 1
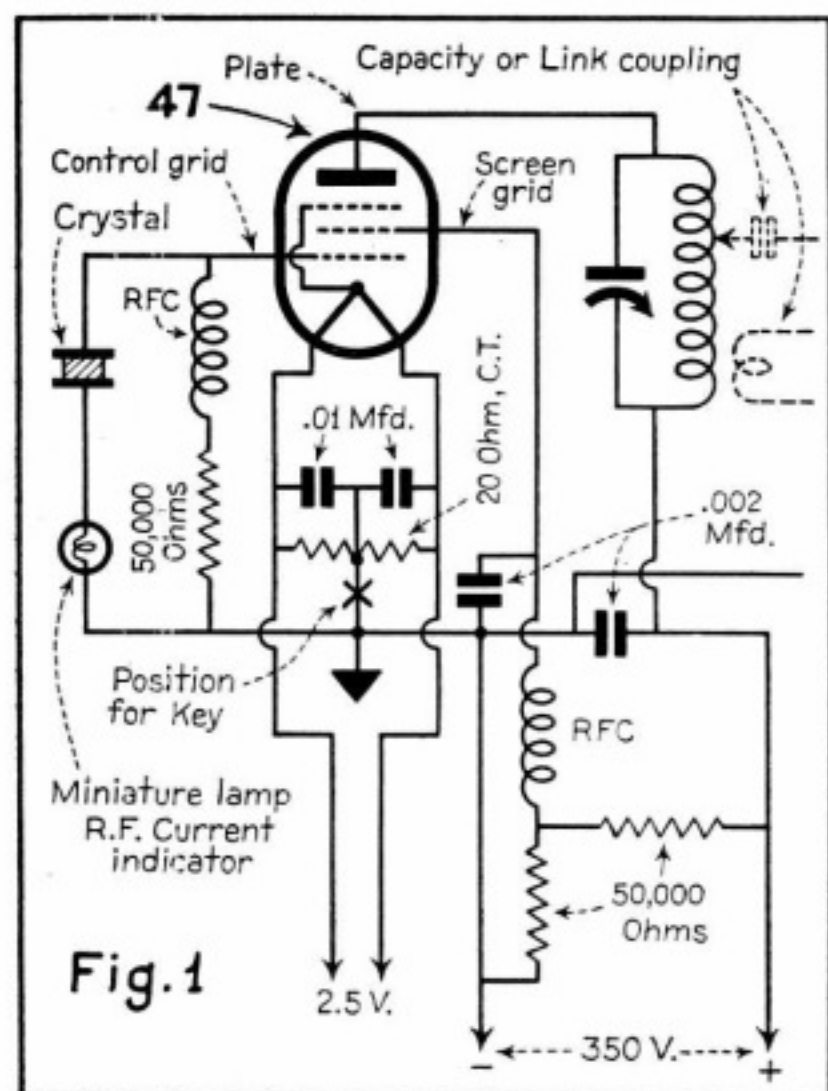

Simple Pentode Crystal Controlled Oscillator

and through the elimination of electrostatic lines of force from plate to grid, the control grid to plate capacitance is made a very small fraction of its value without the screen-grid. It has been pointed out in numerous texts that a tetrode with the screen by-passed so that it has no impedance in the external circuit is equivalent to a triode. An equivalent triode would be far beyond anything we now have along lines of conventional tube construction, however.

An examination of the family of plate-current curves for a tetrode (the old type 224 is a good example) will show that, for a fixed value of screen-grid voltage, there is little change in plate current after a plate voltage somewhat higher than the screen voltage is reached. Through the region where the plate voltage passes from a value less than the screen-grid voltage to a value above it a dip will be observed in the plate current curve for each value of control grid bias voltage.

Secondary Emission

This characteristic of the tetrode tube is caused by secondary emission from the plate surface and is made to serve a useful purpose in the dynatron oscillator. Under these conditions where the screen voltage is higher than the plate voltage, the electrons passing through the screen-grid to the plate dislodge electrons at the plate.

Fig. 2
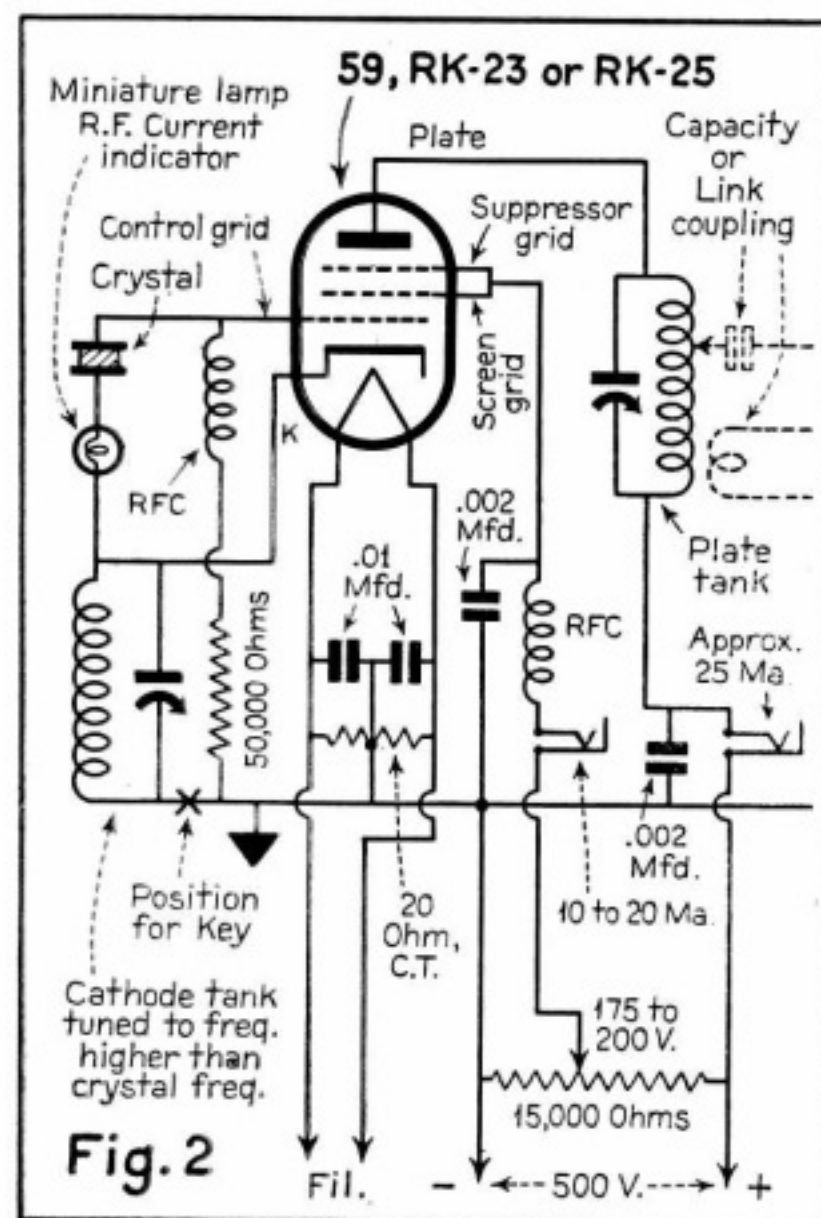

The Tritet Pentode Crystal Oscillator Current

These secondary electrons thus made free from the plate metal are more attracted by the screen than by the plate because of the higher screen-grid voltage. Therefore, the secondary electrons flow inward to the screen. In receivers, secondary emission cannot be tolerated. To eliminate this characteristic in tetrodes, those already designed were changed, principally by the substitution of carbonized nickel for bright nickel in the plate. As a result of this and other corrective changes, there are few tubes available today for dynatron oscillator use.

One very important advantage gained by the insertion of a screen-grid between the plate and control grid of a tube is an enormous gain in the voltage amplification of the tube. This applies to the tetrode as well as the pentode.

The Pentode

The pentode is the familiar tetrode with an additional grid placed between the screen-grid and the plate. This third grid is usually connected to the cathode, as in the 2A5, 41 and 42, or to the filament, as in the 47 or 33. The primary purpose of the third grid is to reduce secondary emission from the plate by placing a zero voltage barrier in front of the plate. The pitch of a suppressor-grid, as the third grid is called, is necessarily coarse to limit the effect of the grid on the flow of electrons

Fig. 3
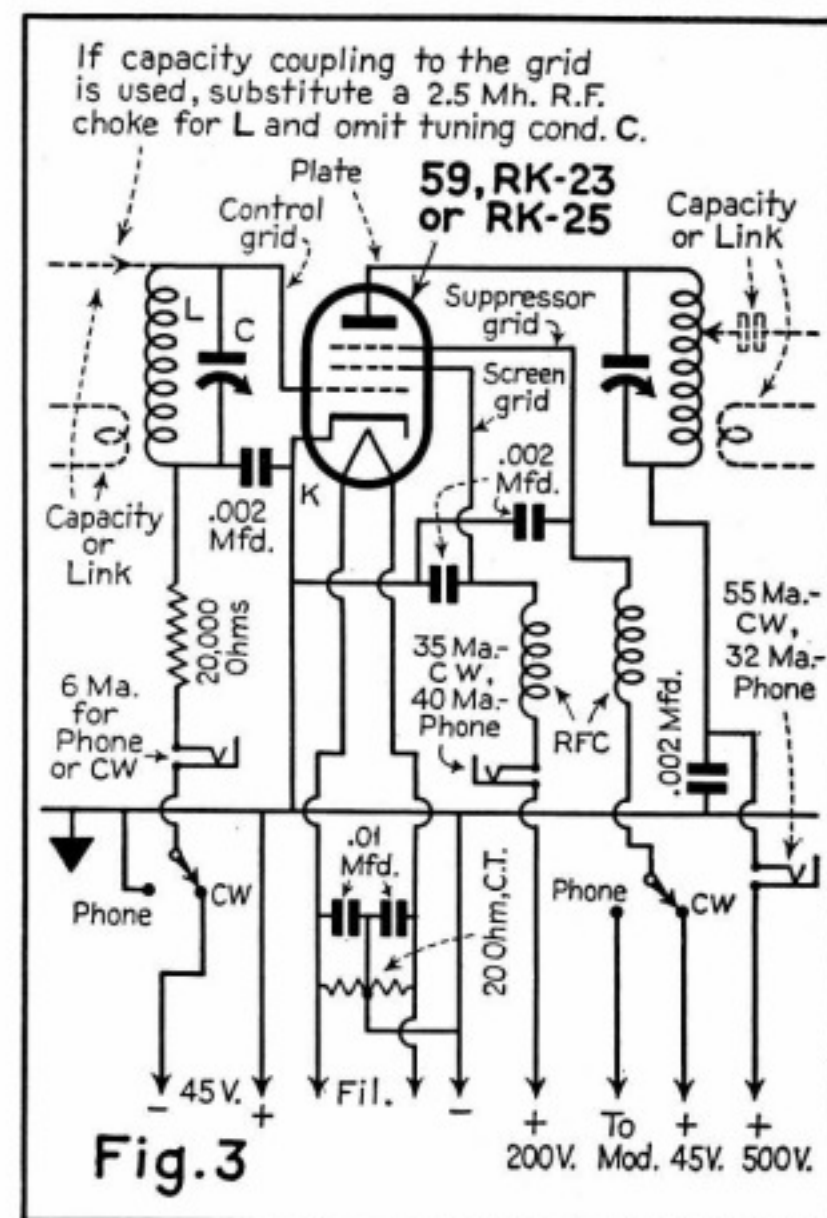

Low Power R-F Pentode Amplifier

from filament or cathode to the plate. In other words, the addition of the third grid at cathode potential does not greatly affect the plate resistance.

In suppressor-grid modulation, the possibility of changing the plate resistance over wide limits is used. The suppressor-grid, if by-passed to the cathode, or if connected directly to the cathode, aids the screen-grid in shielding the control grid from the plate and so makes a further reduction in the control grid to plate capacitance.

In a receiver, with the conditions strictly Class A, the control grid of a tetrode or pentode is never positive and in general remains slightly negative on signals which provide the widest grid swing. Here, the screen-grid current averages not more than 15% to 20% of the plate current. In oscillator or R-F amplifier service under Class C conditions where the control grid becomes positive for a fraction of a cycle the ratio of screen-grid current to plate current increases so that the screen current may be 50% or 60% as great as the plate current. In both of these cases, the screen-grid operates at a voltage from one-half to one-third the plate voltage.

If capacity coupling to the grid is used, substitute a 2.5 Mh. R.F. choke for L and omit tuning cond. C.

RK-20 or RK-28

Power R-F Pentode Amplifier

The discussion of the circuits shown can be limited because all of them are familiar to most amateurs and all have been shown from time to time in construction articles. It is hoped that the comments which follow may be of some value in the practical operation of the screen-grid tubes shown in the diagrams.

Straight 47 Crystal

Fig. 1 shows a type 47 pentode connected in the conventional straight crystal oscillator circuit. As indicated, the circuit is not adapted to doubling. A variation, used successfully over a long period of time by W1GBE has an additional plate tank tuned to twice the crystal frequency placed in series with the regular plate tank which, of course, tunes approximately to the crystal frequency. A tap from the plate end of the harmonic tank provides excitation at double frequency. It will be noted that a miniature lamp is shown connected directly in series with the crystal. This lamp, which can be a flashlight lamp or a dial lamp of the brown bead type (6V., 150 ma.) should be precalibrated by passing battery current through it and noting the brilliancy for steps of current in milliamperes up to approximately 100 ma.

When in circuit in series with the crystal, the lamp will provide a sufficiently accurate measure of R-F crystal current to warn against overloading. This arrangement has been used by many amateurs and the lamp resistance does not seem to affect crystal performance appreciably.

The Tritet

Fig. 2 shows the familiar Tritet circuit introduced by James Lamb. A great deal has been written about the Tritet and it stands out as an ideal arrangement among the circuits available for amateur use. If used as frequency-multiplying oscillator, the 59 works satisfactorily. Where operation as a straight oscillator is desired, with the plate tank tuned to approximately the crystal frequency, tubes having less grid-plate capacitance must be used. Such tubes were not available when the Tritet circuit was announced but they are today and are recommended over the 59 unless type 59 tubes tested for R-F output are available.

Of prime importance is the L/C ratio of the cathode tank circuit; the larger the capacity is made, the better the harmonic output. Most of the mediocre results are often traceable to failure to observe this important specification.

Trouble with this circuit can almost invariably be traced to a 59 tube which may be perfectly satisfactory in an audio circuit. The R-F losses due to getter material deposited on the stem, or even to the type of getter used may be responsible. It will be noted that the cathode is "hot" or carries an R-F potential. Across the cathode tuned circuit is the capacity between the heater and the cathode, but this amounts to only 4 to 5 micromicrofarads and is of little consequence. Heater-cathode leakage, if large, would affect operation and an inactive 59 should be checked for this defect.

It will be noted that a miniature lamp is shown in series with the crystal. Since the adjustment of the cathode tank circuit is
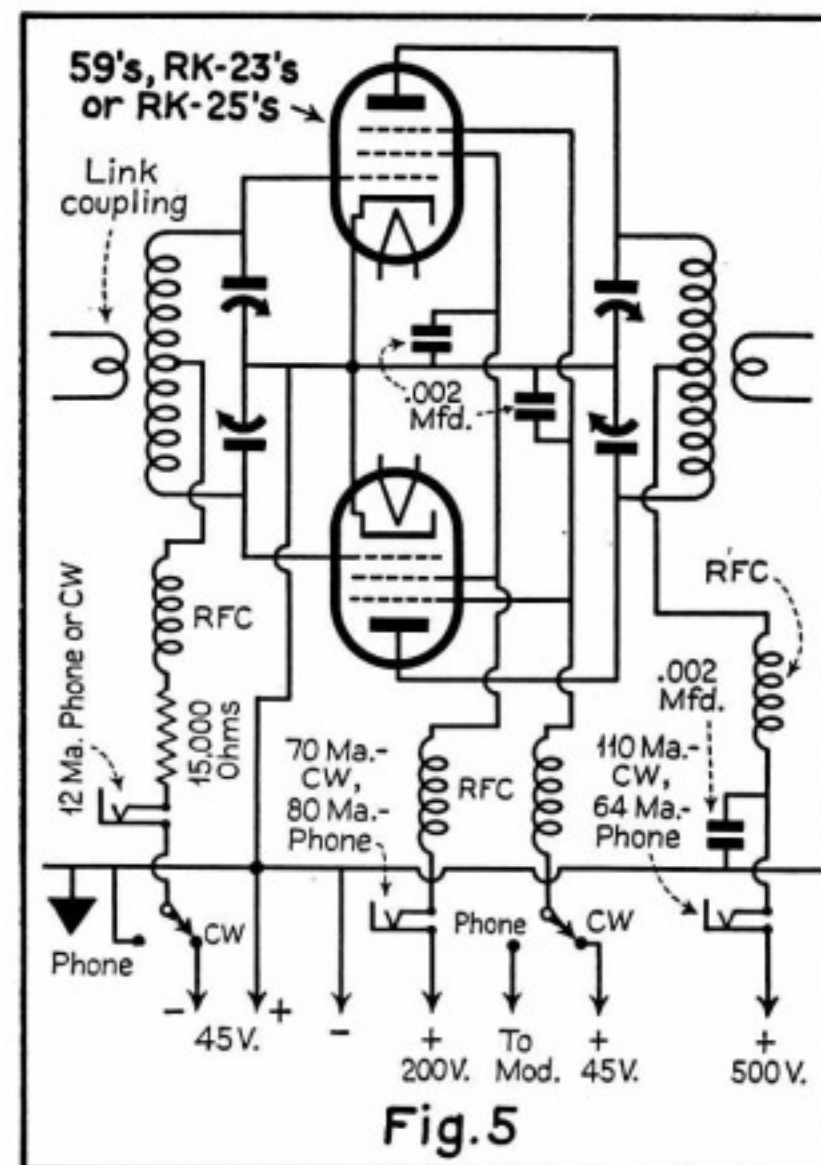

Push-Pull Low Power Pentode Amplifier

used to control excitation, it is highly desirable to have some knowledge of the crystal current and the lamp will be found helpful.

R-F Amplifiers

Figs. 3, 4, 5 and 6 show arrangements in which pentodes are used as R-F amplifiers. All of the tubes can be used as doublers but the 59 is not recommended for buffer service because of its relatively high grid plate capacitance.

The approximate values of current which should flow in each circuit are shown on the diagrams. The excitation should be sufficient to produce at least the current shown for the control grid circuit. With this excitation, the screen-grid current will have a value approximately as shown and it should be possible to loop the plate circuit to the current value indicated.

Over-excitation is fully as bad as under-excitation in a pentode used as an R-F amplifier. This is true because the screen-grid circuit contains no impedance to R-F and over-excitation increases the flow of screen current to values which cause overheating of the screen and the waste of considerable power. The most noticeable effect of over-excitation is a loss of power in the plate circuit due to the diverting of more than the proper share of the available filament or cathode electrons to the screen circuit. Thus, it may be seen that the screen grid current is a good indicator of proper excitation.
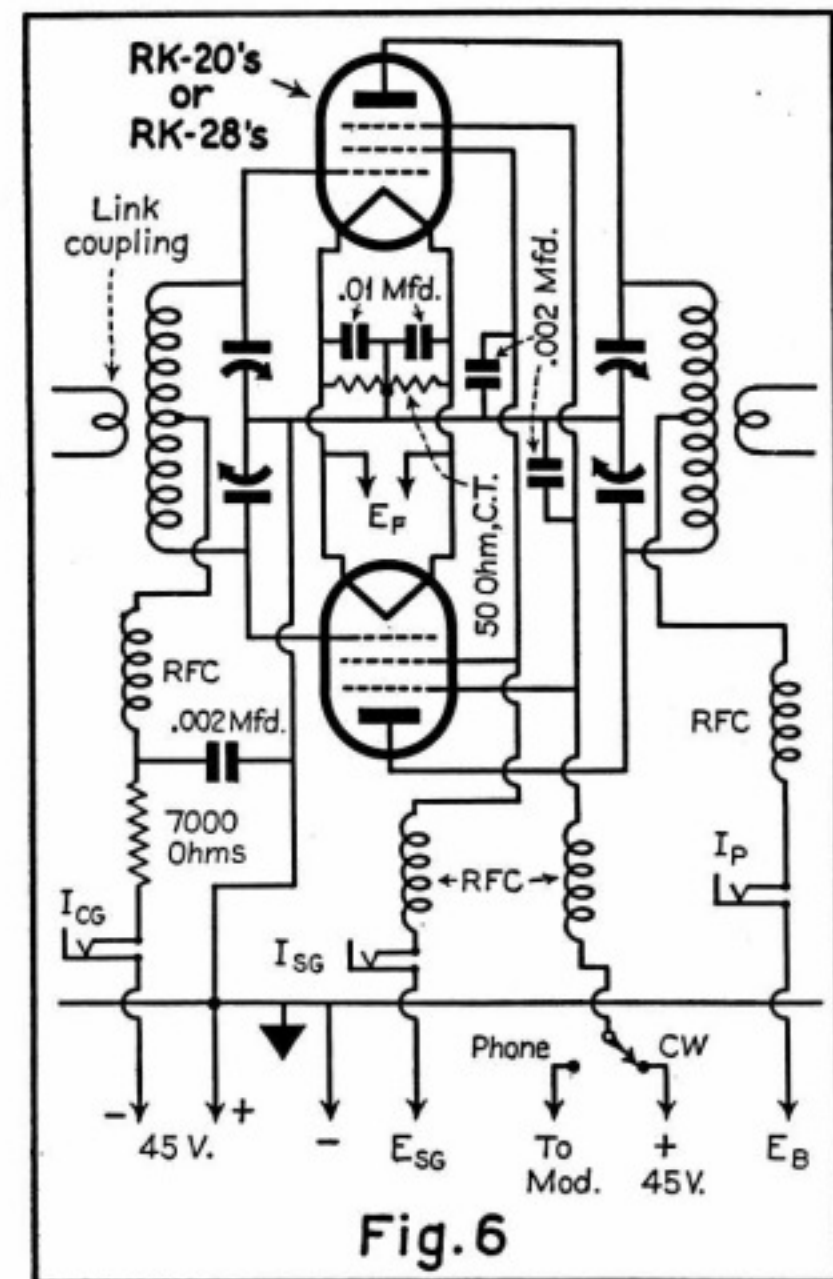

Push-Pull Power R-F Pentode. Values of Icg, Isg and Ip are twice corresponding current values shown in the Tables of Fig. 4. All voltages the same.

Biasing

In Figs. 3 and 5, a switch is shown in the control-grid return circuit arranged to connect the grid leak either to ground or phone or to 45 volts negative for CW. The purpose is to bring the plate and screen current to zero when the excitation is removed as in oscillator keying. Where the plate and screen voltage is cut off by the key, the grid leak can be connected direct to ground. Figs. 4 and 6, which show power arrangements, call for a fixed negative bias of 45 volts in addition to the bias developed across the grid leak. This is advisable since high voltages are used on the plate and loss of excitation would permit an undesirable high plate and screen current. While covering the subject of control-grid bias, it might be pointed out that the bias voltage required is determined by the

screen-grid voltage rather than the plate voltage. Practically all of the R-F pentodes now available to the amateur are so designed that the best control-grid bias is approximately 100 volts negative.

The coupling of the load to the plate circuit should be adjusted so that a noticeable dip occurs when the plate tuning condenser is adjusted through resonance. If the control-grid current and screen-grid current values are about as shown in the diagrams, indicating ample excitation, and the plate current fails to dip when the tank circuit is tuned through resonance, the load coupling is too tight. Loosening the plate load coupling together with retuning the

plate tank will provide higher-R-F output at a lower plate current.

Shielding

Fig. 7 shows one desirable way to shield the input circuit of a pentode from the output circuit. With either link or capacity coupling, the plate circuit of the driver stage must be considered *a part of the input circuit of the following stage.* Therefore, the plate tank of the driver should be shielded from the field around the plate of a power pentode. This electrostatic field surrounding the plate is strong enough to light a neon lamp within three inches and to produce feedback effects at a much greater

distance. The higher the operating frequency, the stronger this coupling effect becomes.

The collar surrounding the lower part of the tube and extending up to the lower internal shield should clear the bulk wall by at least one-sixteenth inch. No shielding of any kind should be placed close to the plate or at the plate end of the tube. Close shielding at these points would interfere with heat radiation and might cause destruction of the tube if a flashover from plate to shield should occur.

While the baffle shield shown in Fig. 7 may not be required on frequencies below 15 megacycles, such a shield would be of value at ten meters.

The by-pass condensers and R-F chokes associated with the screen-grid and supressor circuits should be mounted at the tube socket.

Oscillation Troubles

In closing this discussion of screen-grid tube circuits it might be well to suggest that suppressor grid modulation is difficult to control at frequencies above 30 megacycles and is not recommended above this frequency. Also, oscillation trouble can almost always be traced to poor shielding, insufficient control-grid bias, defective R-F chokes, or the use of electrolytic or paper by-pass condensers instead of mica.
Pentode Amplifier Shielding

IMPROVING MODULATION IN TRANSMITTERS

In plate or Heising modulation the modulator and the modulated amplifier is the heart of the transmitter and their adjustments are quite critical.

If the modulator is to operate as a class A tube, the plate current should be midway between that obtained by zero and cut-off bias. The tubes most suitable for use as class A modulators are those having large undistorted power output. They generally have low plate impedance and low amplification factor. When operated as class A the output wave will have the same shape as the input wave and must be able to supply a 50 per cent increase in the transmitter output power if 100 per cent modulation is desired.

The modulated tube is usually worked as a class C amplifier and the bias must be approximately twice that required to give cut-off bias and plate current saturation must be supplied by the excitation from the preceding stage. Class C modulated amplifiers require more excitation than similar amplifiers in C. W. transmitters and a surplus of excitation is very desirable.

It is just as necessary for the modulation to work into a load resistance of proper value for maximum undistorted power output as it is for an audio output tube to work into the proper load value for maximum undistorted power output; therefore, there is a proper value of class C amplifier plate current for any modulator amplifier combination and the amplifiers must be operated at this value of current if maximum undistorted modulation is to be obtained.

In class C amplifiers, by making the load resistance high compared with the plate resistance of the tube it is possible to reach near distortionless modulation regardless of

remaining adjustments, although the power output is sacrificed.

When modulated, properly adjusted class C amplifiers will develop a 100 per cent modulated wave with very little amplitude distortion and no frequency or phase distortion.

The adjustment of the tank circuit should be for maximum tank current with minimum plate current. Each change in coupling or excitation to the grid may necessitate retuning of the tank circuit, likewise when the antenna coupling is made.

As the turns of the primary winding are decreased the step-up ratio of the transformer is increased, therefore the primary load impedance is decreased and the plate current increased. In any tube circuit, if the load resistance is too high, the plate current will be high without an increase in antenna current.

For best adjustment of antenna inductance start with minimum number of turns and gradually increase until proper loading is obtained but never to a point where increased plate current does not increase the antenna current.

The power amplifier tube draws more plate current when the antenna tuning is near resonance, and the change in plate current as the plate circuit tuning condenser is moved through resonance should be smooth. A sudden sharp change in plate current generally indicates the tube is breaking into oscillation and may have to be better shielded in order to eliminate this condition.

Downward modulation is caused by a reduction in power output with modulation when there should be an increase in power output. It may be due to any of the following:

Insufficient class C amplifier bias of modulated amplifier, or R-F excitation.

Excessive class C amplifier plate current causing overloading of the modulator.

Before neutralizing or tuning it is necessary to remove any parasitic oscillations that may be present.

Parasitics result from stray couplings and resonant circuits, connecting wires, etc. and absorb energy. They can be eliminated by inserting suppressor resistors in the grids of the offending stage.

To test for parasitics disconnect the power amplifier from the preceding stage. Set the power amplifier tuning condenser at maximum. Set neutralizing condenser of minimum. Change neutralizing condenser from the minimum to maximum and if meter readings do not change, no parasitics are present.

To neutralize remove plate supply from tube.

Touch neon tube to grid or plate terminal of tube and adjust tuning condenser until tube glows with neutralizing condenser set at minimum.

Increase the value of the neutralizing condenser until the neon goes out and for finer adjustment, rotate tuning condenser again; also the neutralizing condenser.

Now turn the condenser through resonance and watch the grid meter. If any flicker in the grid meter is shown make a slight adjustment to the neutralizing condenser until there is no change in the grid reading when tuning condenser is turned through resonance. The circuit is then neutralized.

A 20 WATT 160 METER PHONE TRANSMITTER

HERE is a radio phone transmitter ideally suited to the beginner in amateur radio activities. Receiving type tubes are used throughout—thus making the initial investment slight. Its features are as follows: a minimum number of tubes, few components, simple construction, and stable dependable operation.

The functions of the tubes as shown in the schematic diagrams as shown below and on the opposite page are a 2A5 oscillator link coupled to two 45's in parallel. These parallel tubes operate as a very efficient Class C amplifier supplying a full 20 watts of output. The modulator unit which is built on a separate chassis consist of a 56 followed by a 53 driver which feeds another 53 operated as a Class B amplifier. An output of 10 watts from this unit fully modulates the Class C stage 100%.

A single power supply unit using a type T-248 power transformer supplies the plate and filament voltages for all the tubes in the transmitter. The filter chokes have excep-

tionally fine regulation, thus providing dependable operation regardless of change in load or line voltage. While this transmitter is exceptionally efficient on the 1750 kilocycle band it should not be used on the higher frequencies. This is because the economy of the design and the lack of a buffer stage in the R.F. portion may cause severe frequency modulation with resultant broad-band, off frequency characteristics. This is in direct violation of the F.C.C. However, this does not in any way detract from the usefulness of this rig on the 160 meter band.

Data for coil construction for this simple phone transmitter can be obtained from instructions given in the coil chart. The values of all other parts are listed below. The adjustment of this transmitter is unusually easy. Tuning of the R.F. end is simply a matter of tuning tank circuit to resonance. There are no tricky adjustments of frequency doublers or neutralized buffers to complicate the job—that is what makes it an ideal unit for the beginner.

40 WATT C.W. AND PHONE TRANSMITTER

This low power transmitter may be used on 20, 40, 80 or 160 meter bands for C.W. or 20, 80 and 160 meter bands for phone.

The tube line up in the R-F end consists of a crystal control type 42 oscillator feeding two 42's which operate as frequency doublers. When used as a buffer stage on the fundamental frequency, the filament of one of the 42's is opened.

The modulator uses a type 77 tube followed by a type 59 tube which is the driver for a pair of 59's in Class "B". The power

amplifier stage is conservatively rated at 20 watts which is sufficient to drive the R-F end to 100% modulation. The power supply of the audio frequency unit uses a type 83 rectifier in conjunction with a type T-248 power transformer. The fine voltage regulation of the power unit is further aided by the use of a husky swinging choke in the filter input circuit.

The power supply for the R-F section of the transmitter requires only two transformers and a single rectifier tube, thus simplifying construction and keeping the cost to a minimum.

100 WATT C. W.—45 WATT PHONE TRANSMITTER

CONTROL grid modulation provides the most economical method yet devised for phone use. The circuit shown below and on the opposite page exemplifies the simplicity of this application. However, this type of modulation permits an output of only approximately 45 watts when used as a phone transmitter.

The tube line-up of this grid modulated transmitter is: a 42 pentode as a crystal controlled oscillator, followed by two 46 type tubes in parallel for the buffer stage. These are coupled to a 203A triode which is grid modulated.

The audio frequency amplifier contains two type 76 tubes in cascade operating as voltage amplifiers, feeding into a type 42 pentode power amplifier which is a transformer coupled to the control grid of the 203A R.F. power amplifier.

The power supply unit for this rig uses the popular triple winding plate transformer thus providing good voltage regulation with a minimum number of parts. The output is adequately filtered by

two type T168 and two type T154 filter chokes which remove all traces of A.C. ripple.

Adjustment of the R.F. Class "C" stage is accomplished by varying the bias of the 203A in order to obtain twice cut-off bias. For phone operation the antenna coupling should be increased until the 203A plate current reads approximately 200 MA. The bias is then varied until the plate current drops to about half this value. Then, with a constant pure tone signal, 100% modulation is indicated by a rise in the amplifier plate current of approximately 12 MA. With speech, the current increase is about 6 MA.

The operating conditions of the 203A amplifier tube in this circuit are as follows:

Plate voltage..........1120 volts	D.C. plate current....110 MA.
Carrier power..........45 watts	Peak power............180 watts
Plate efficiency 34%	D.C. grid bias........235 volts

A 100 WATT C. W. TRANSMITTER

THIS transmitter is a typical dyed-in-the-wool amateur circuit, the type that developes every ounce of antenna power regardless of how soon the tubes go "west". For this reason we do not guarantee that the tubes used in this circuit will stand up for six months—but on the other hand, the transmitter will "get out" far better than larger or more expensive rigs. The operation is limited to C. W. only. It positively cannot be used for phone at the voltages specified in the schematic. An examination of the circuit shows several variations from usual practice. A type 42 pentode crystal controlled oscillator of conventional design is link coupled to two 210 tubes in parallel in the power amplifier. It will be noticed that the plate of the oscillator tube is connected to ground, which appears at first glance to be an error in the diagram. This is done for a particular purpose, however, and is correct as shown. The bias for the ampli-

fier tubes is obtained from the oscillator power supply thus simplifying the power supply system and minimizing the number of parts which would otherwise be needed. It is also important to note that the cathode of the oscillator has a potential difference of 400 volts with respect to ground. This makes it necessary to key in the oscillator plate circuit instead of the customary cathode, to avoid a hot key.

The power supply for this transmitter derives both voltages from the one high voltage transformer. This is made possible through the use of our newly developed triple winding plate transformer. This arrangement is a sound and economical method of obtaining the required voltages.

The husky chokes used in the filter section permit minimum condenser capacity and at the same time provide adequate filtering to meet existing regulations for pure D.C.

A 150 WATT C. W.—35 WATT PHONE TRANSMITTER

THIS transmitter is of particular interest to the amateur who desires a medium power C. W. xmitter which can also be used for low power phone. For C. W. a full 150 watts of R.F. is available. When suppressor modulated, 35 watts of power can easily be obtained.

The tube line-up of the R.F. end is entirely conventional and consists of one section of a 6A6 tube utilized as a crystal oscillator. The other triode section of this tube is used as a frequency doubler. This application is often referred to as the "Jones System" and has been used very successfully by many amateurs. The output of this tube is fed into push-pull grids of another 6A6 tube, the plates of which are connected in parallel. This tube combination supplies ample excitation to the two RK-20's in the final amplifier operating Class "C".

The modulator system, suppressor modulates the RK-20's which reduces the size and cost of the audio frequency portion of this transmitter. This type of modulation is to be highly recommended especially when cost is of prime importance.

The audio frequency end is a tried and old reliable circuit. A type 76 triode tube resistance coupled to a 42 pentode tube provides a gain of 50 DB. Careful design makes the output completely hum-free. Actually the hum level is 65 DB. below maximum power output.

Two separate power supplies are used for this transmitter; one for the R.F. section and audio amplifier respectively. The R.F. section utilizes our new triple winding plate transformer to full advantage thereby materially lowering the cost of the entire unit.

The transformers and chokes used in this circuit are rated well under their safe current carrying capacity assuring absolute trouble free operation.

Coil details for the various amateur bands can be determined from the coil chart.

RADIO FREQUENCY POWER SUPPLY
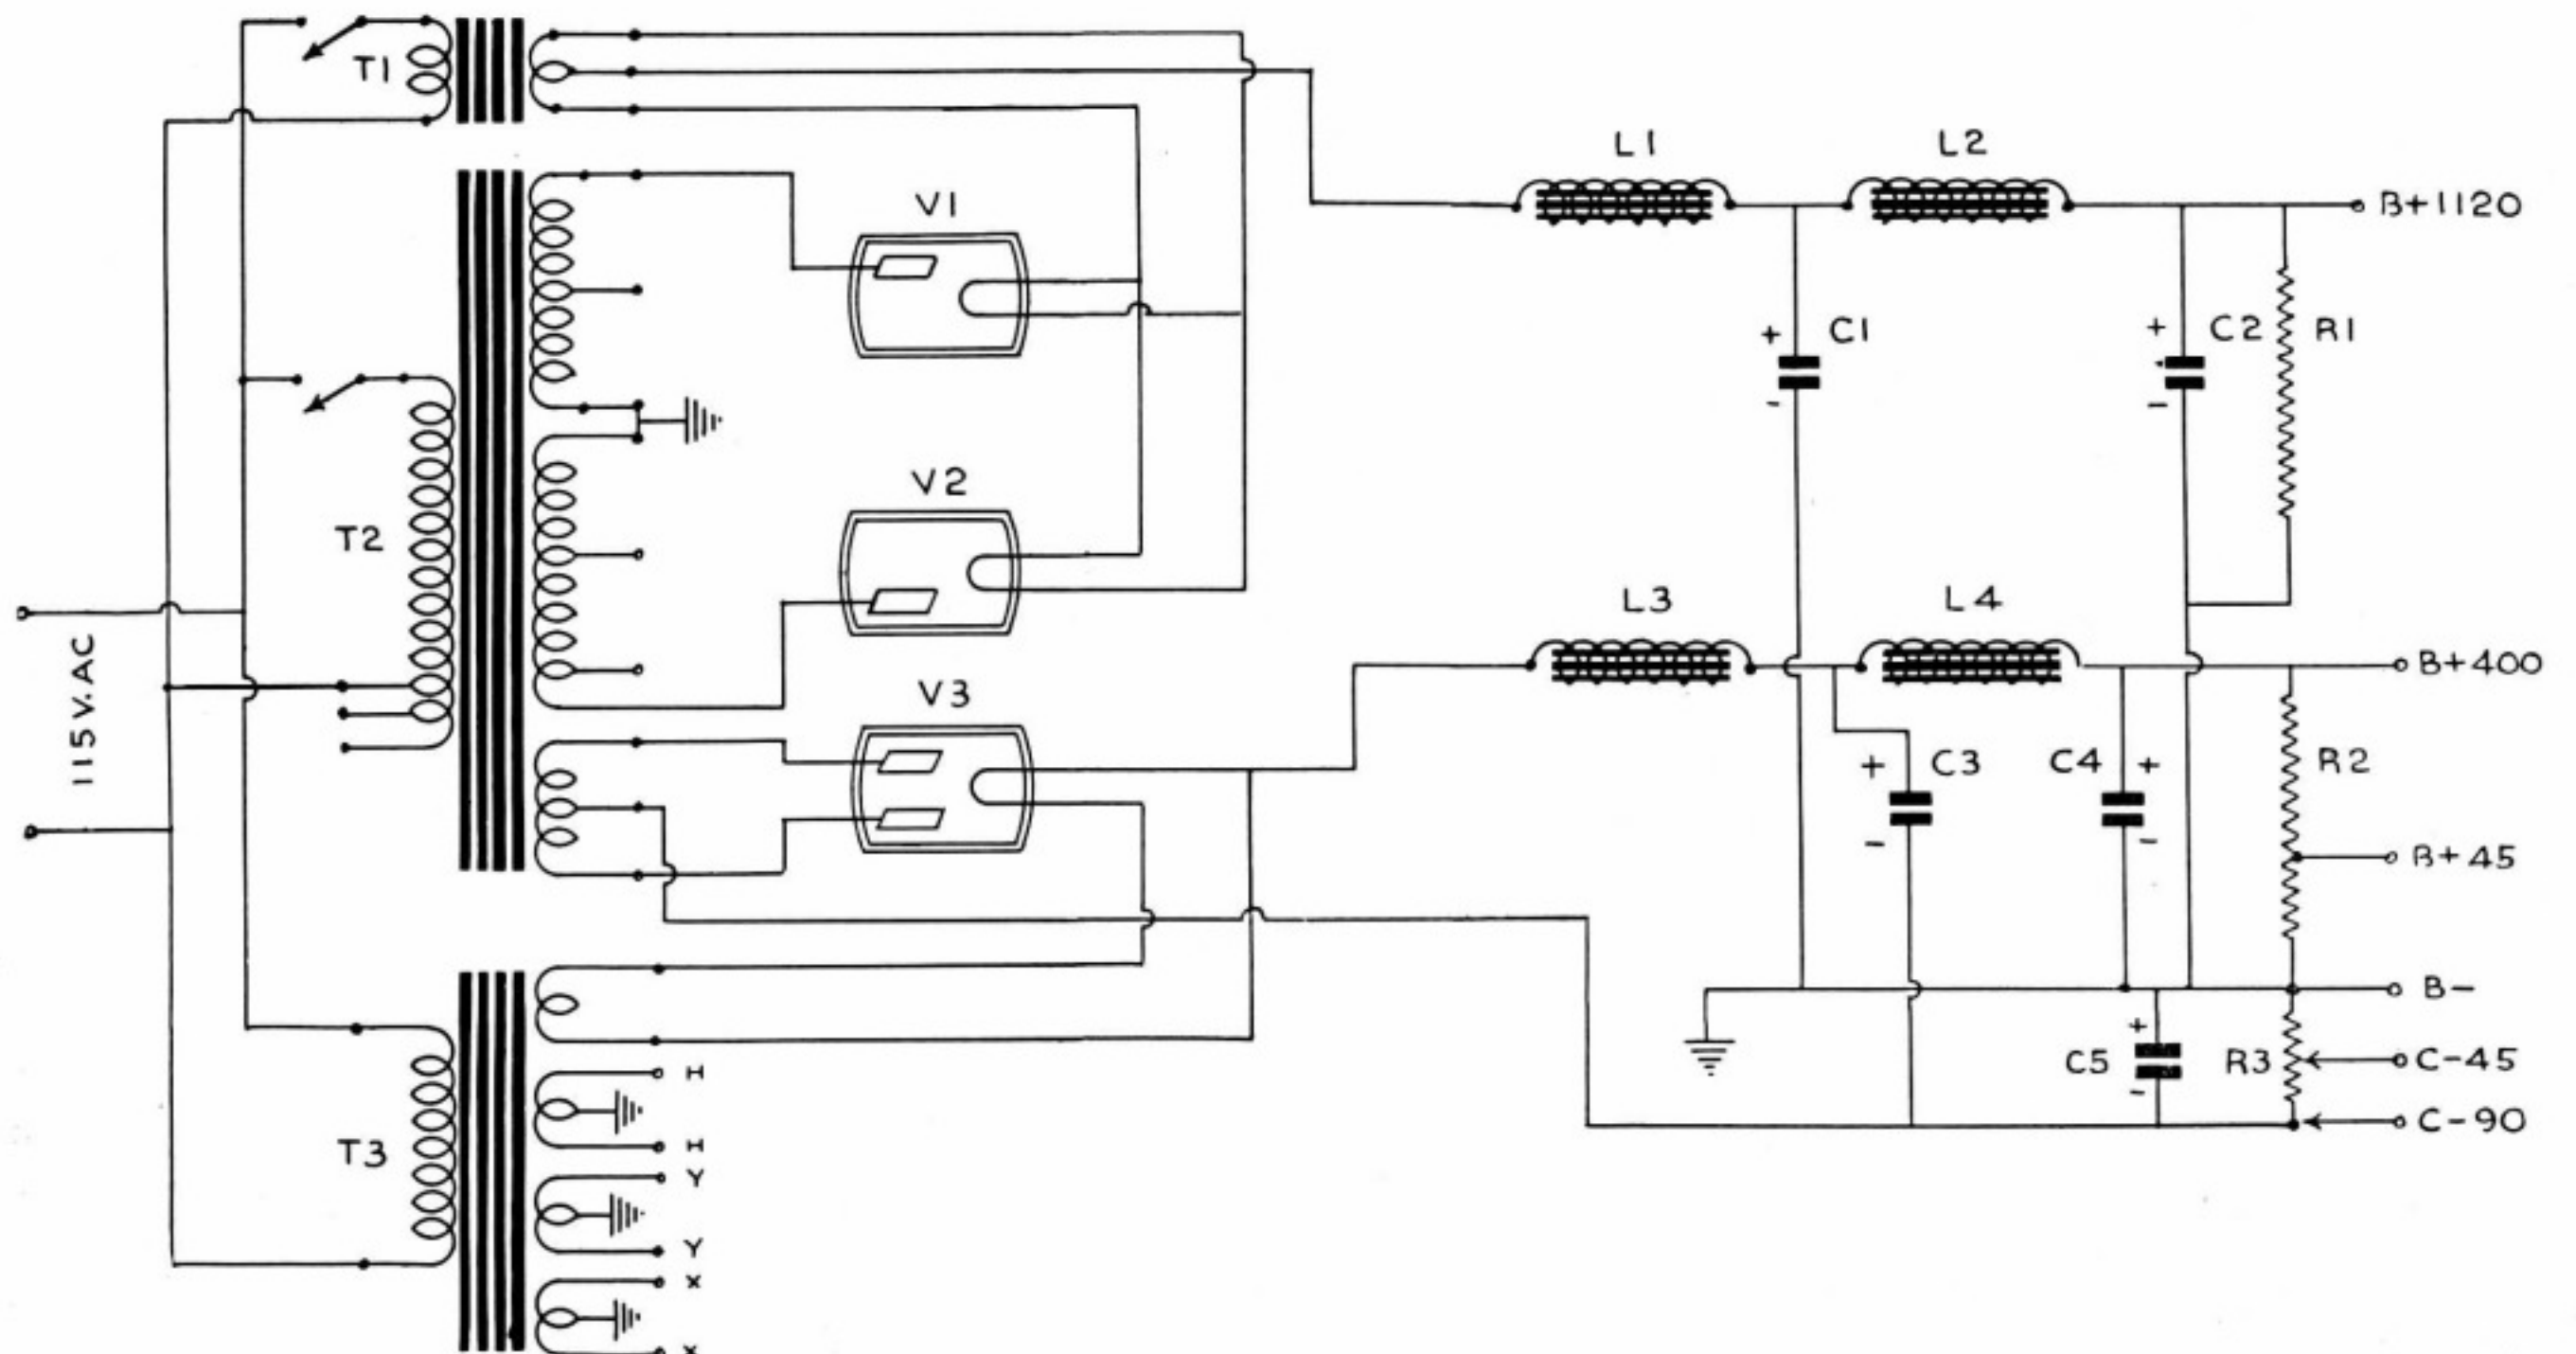

A 200 WATT C. W.—53 WATT PHONE TRANSMITTER

ONE of the outstanding features of this medium power C. W. and low power phone transmitter is the use of the 803 type pentode tube. Though the initial cost of the 803 tube is much higher than triodes the relatively few parts required to construct this modern xmitter actually effects a saving. In addition to this the final amplifier requires no neutralizing which greatly simplifies putting it on the air.

In the R.F. end of this transmitter one section of a 6A6 tube is used as a crystal oscillator and the triode section is used as a straight amplifier or frequency doubler. Due to the low excitation requirement of the 803 tube, adequate driving power is obtainable on all bands from the single 6A6 tube.

The modulator unit which is shown below the R.F. schematic has sufficient gain to fully modulate the 803 tube even when used with a low level microphone. When this unit is carefully adjusted, exceptionally fine quality is obtainable despite the opinion of many that suppressor grid modulation has too many limitations. If a crystal microphone is used in place of the carbon type, the input transformer T1 may be replaced with a 1 to 5 megohm one watt resistor.

It is interesting to note that changing from phone to C. W. operation is quickly and easily accomplished by throwing a single pole double throw switch from one side to the other.

The design of the power supply is also straight forward. Here economy is also featured due to the use of the type T657 plate transformer. The plate voltages for the low voltage stage are obtained from a separate transformer which also supplies the filaments for the modulator power amplifier and the R.F. oscillator.

The prospective builder of this xmitter should thoroughly digest the article "R.F. Pentodes" in another section of this Manual.

A 200 WATT PHONE AND C. W. TRANSMITTER

THIS rig might be termed the most popular example of a medium power amateur transmitter. It is straightforward through the entire R.F. and modulator sections. This can be attested to by its universal acceptance by the large number of amateurs who are using this identical circuit.

Functionally the xmitter is as follows: a 59 tube is used as a tri-tet oscillator which is capacitively coupled to another 59. This stage is used as a doubler or straight buffer stage depending upon the crystal used and the frequency desired in the final. The doubler or buffer stage is followed by an 841 which is link coupled to a pair of 800's in the final Class "C" stage.

The audio system consists of a 76 resistor coupled to another 76 as voltage amplifiers. This is fed into two type 45 tubes functioning as a driver stage for the two 800's in Class "B" which produces a full 100 watts of audio power.

Two power supply units are required for this transmitter. These are very similar in design—both use the efficient triple winding plate transformer which reduces the number of transformers in the power supplies to an absolute minimum. The power supply systems are rated well over the highest power loads which will be imposed on them in this circuit.

A 500 WATT C. W.—PHONE TRANSMITTER

THE new type 838 zero bias tubes are used to full advantage in this transmitter and because of the excellent characteristics of these tubes, this unit has become one of the most popular for amateurs who go in for high power jobs.

A 59 is used in the conventional tri-tet circuit followed by two buffer stages using a type 10 and type 38 tube. The output of this is fed into two type 38's Class "C" developing a "wallop" of 500 watts.

The audio end consists of a 76 feeding another 76 as a voltage amplifier which is coupled to two 2A3's in push-pull parallel.

These tubes drive the two 838's in Class "B". Since no grid bias is required in the Class "B" stage, adjustments of this circuit are greatly simplified.

The R.F. power supply uses one of the new triple winding transformers (a new exclusive Kenyon development). By means of this unit the number of transformers is reduced to a minimum.

The power supply for the speech amplifier is similar in design to that for the R.F. section and uses the same type of transformer. The filtering afforded by the large chokes in this supply unit is adequate to eliminate entirely all objectionable ripple.

MODULATION POWER SUPPLY
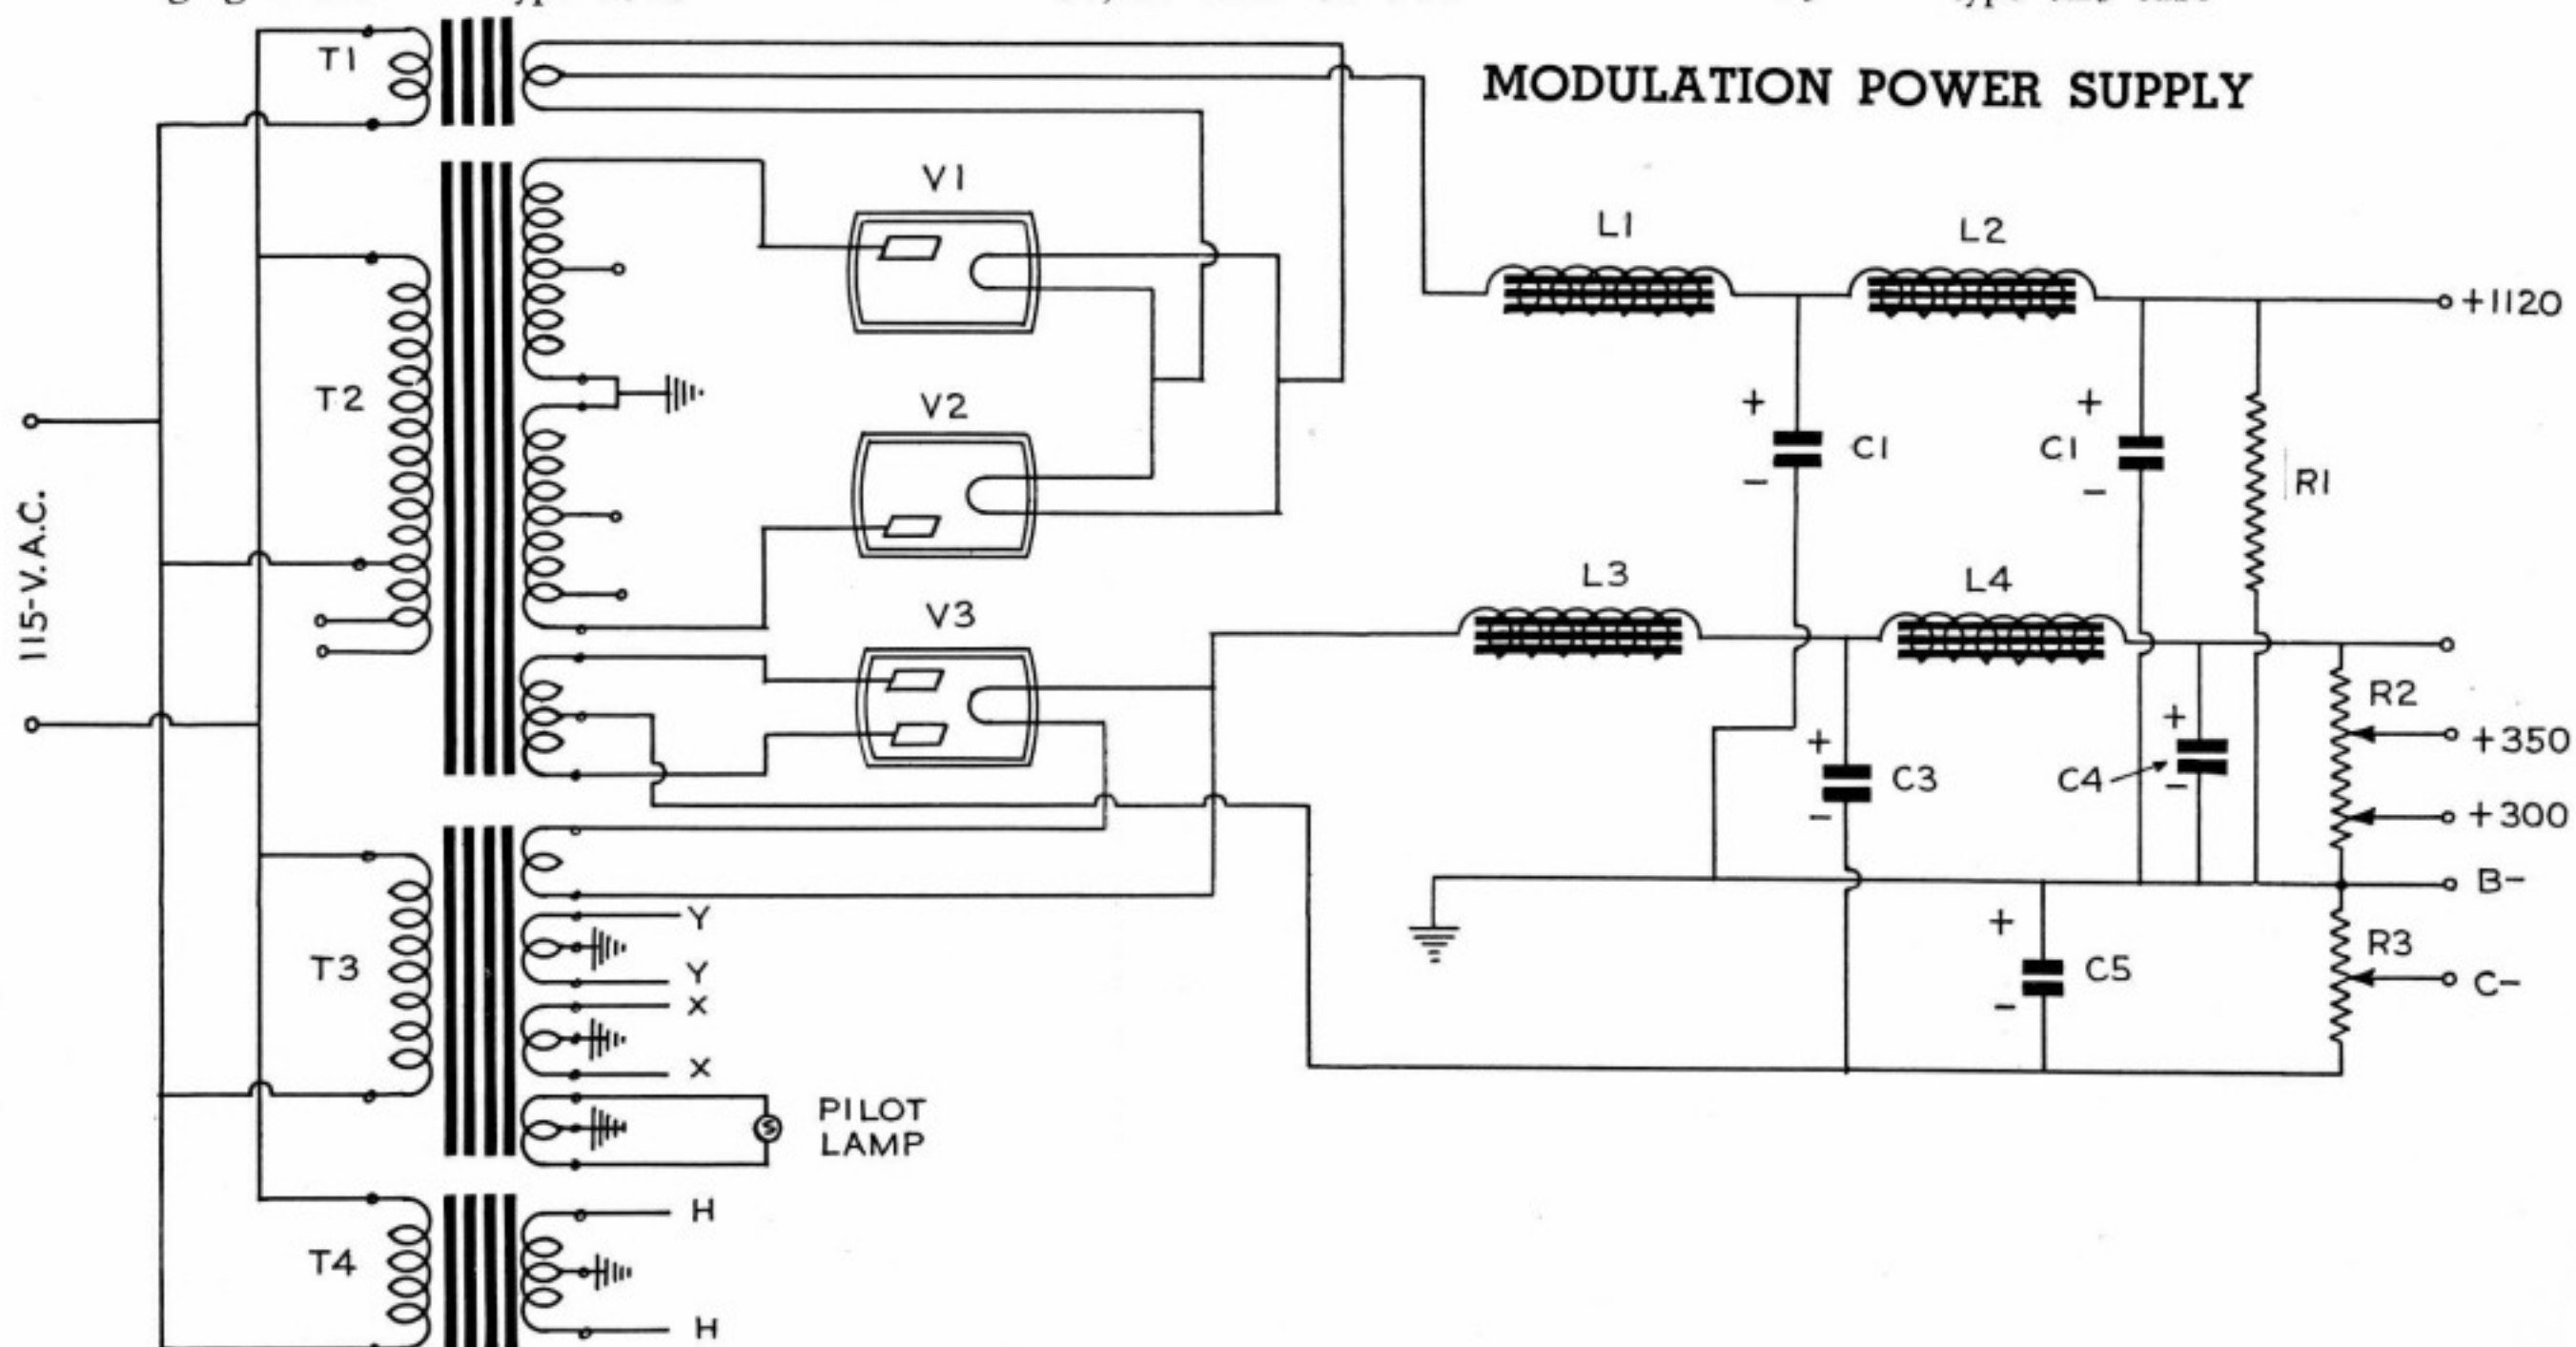

1 KILOWATT PHONE AND C. W. TRANSMITTER

MODERN trend in high power transmitters is toward eliminating as many stages as possible, consistent with good results and superb quality. This transmitter has been designed with this point in view, as well as economy as to space requirements wherever possible.

The tube line-up in the R.F. section is a 6L6G beam power tube used as a crystal controlled oscillator, which feeds into an HF 200 buffer amplifier driving two HF 300's in the final.

The A.F. section for "phone hounds" is not shown in its entirety. Only the final output tubes are shown. These HD 203A's are capable of delivering a full 500 watts of audio power when properly driven. The reader is requested to refer to the 36 watt amplifier using four 2A3's (Page 15). This amplifier when used with a type T-260 output transformer will drive the two HD 203A's to full output with little distortion.

The husky modulation transformer is capable of carrying the full R.F. Class "C" load without attenuating the low notes—a factor to consider when constructing a transmitter of these proportions.

MODULATION UNIT
MODULATION POWER SUPPLY
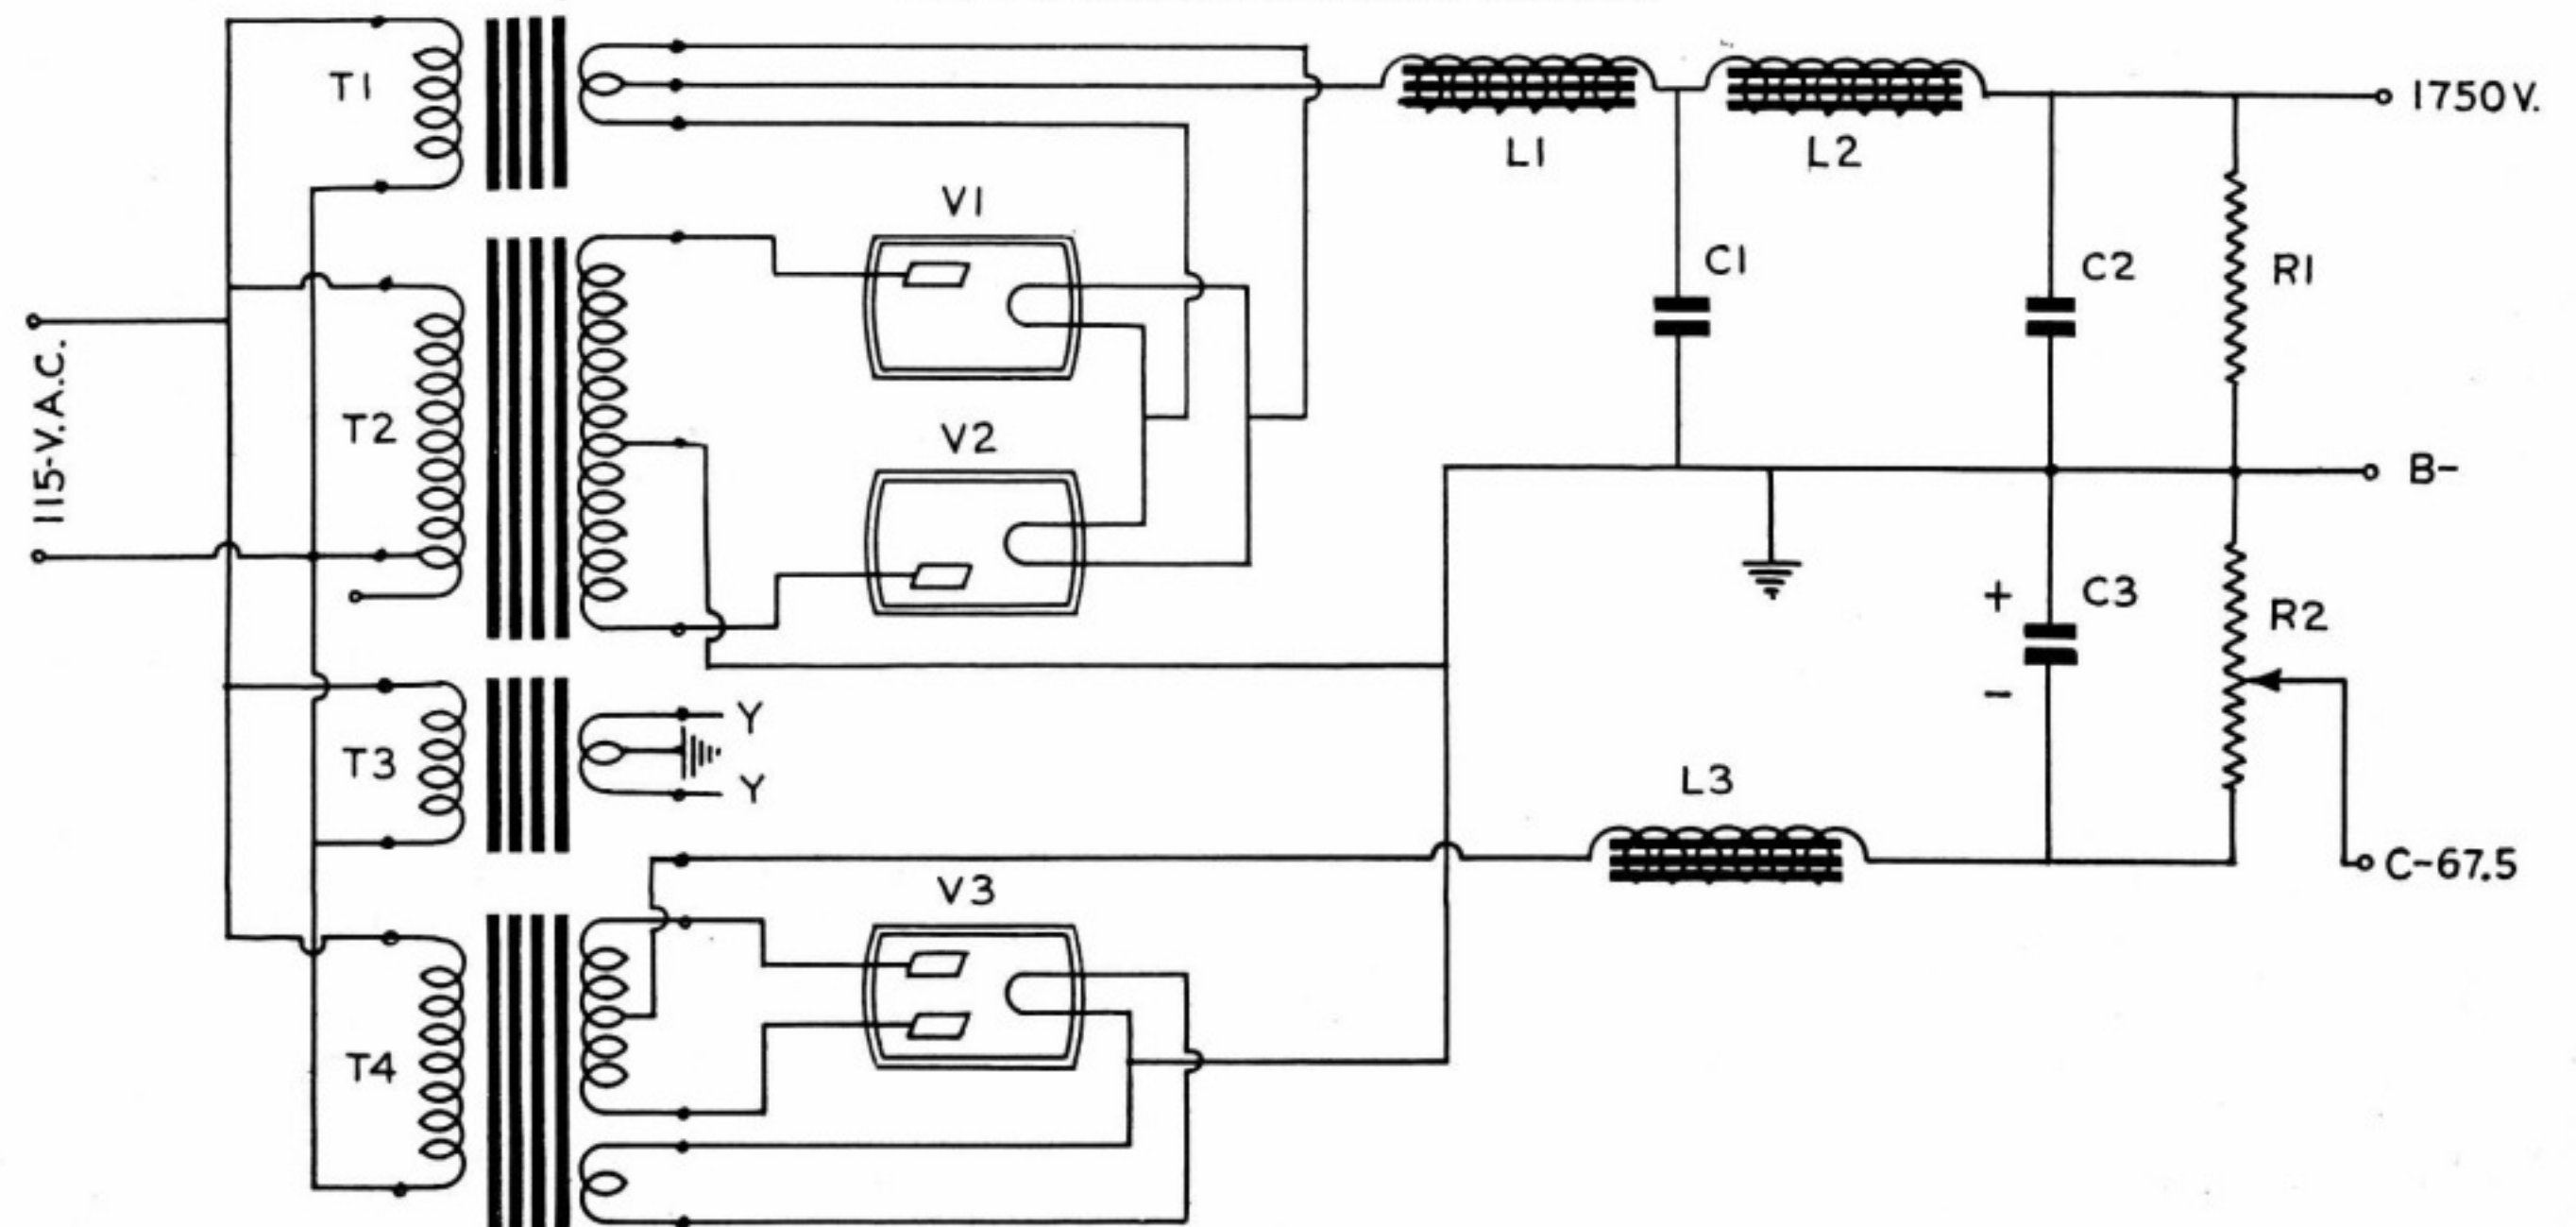

A 100 WATT HIGH FREQUENCY PHONE TRANSMITTER

THIS ultra modern 56 megacycle transmitter is the practical answer to frequency stability on the higher frequencies. The oscillator is a tri-tet with suppressor feed back to increase the harmonic output. The fundamental crystal frequency used to obtain 56 megacycle operation is 7 MC.

Modulation is accomplished with an audio frequency amplifier comprising four type 46 tubes in push-pull parallel in the output. This audio system conservatively develops a power of 50 watts with low distortion or harmonic content.

Two separate power supplies are used in this transmitter; one supplies plate and filament current for the R.F. portion of the circuit and the other the speech amplifier. This is necessary due to the large current fluctuation in the Class "B" circuit. The swinging choke L1 in the audio power amplifier supply provides good regulation necessary in a Class "B" circuit such as this where the current drain requirements from static load to full output are so varied.

COIL DETAILS 7 MC CRYSTAL—56 MC OPERATION

Coil	Turns	Winding Spaced To	Coil	Turns	Winding Spaced To
L1	9	1 inch	L8	4	1 inch center tapped
L2	8	½ inch	L9	8	1¾ inches center tapped
L3	4	⅜ inch			
L4	9	⅝ inch			
L5	10	1 inch			
L6	7	1 inch			
L7	3	¾ inch			

Coils L1 to L5 are wound on 1½ inch plug-in coil forms.
Coils L6 to L9 are wound 1¼ inches in diameter, self supporting.
Condenser C22 is a home made three plate split stator tank condenser, plates spaced ¼ inch apart. The value of other components are included in the list of parts.

MODULATION UNIT

MODULATION POWER SUPPLY

A 5 METER TRANSMITTER AND RECEIVER

THIS circuit differs from the standard transceiver in that separate tubes are used for the oscillator of the transmitter and the detector of the receiver. Because of the difference in the requirements for these two components of the system, it was found that the common method of using only one tube for both operations with a change-over switch for shifting from one to the other, was not entirely satisfactory. If the constants were adjusted for receiving, the oscillator characteristics were poor and vice-versa.

This circuit avoids this difficulty by using separate tubes, tuning circuits and even antennas so that the two circuits are entirely separate. This results in characteristics which improve the overall operation of this unit.

Since the audio frequency amplifier and modulator system are so similar in requirements and operating conditions, the same unit serves the double function. This is obtained with a double winding input transformer and a change-over switch at the output for feeding into phones or into the oscillator.

The change-over switch shunts the amplifier from "transmit" to "receive" position and also opens the filament of the detector tube for sending and the oscillator tube for receiving. The same switch also opens the microphone circuit when receiving, to economize in battery consumption.

A potentiometer connected across the secondary of transformer T1 operates as volume control in the "receive" position and as microphone gain control in the "transmit" position. A separate variable rheostat acts as a regeneration control.

A TWO-TUBE 5 METER TRANSCEIVER

THIS small transceiver, for portable use, to be thrown into the car or taken to Hamfests is a popular item due to its low cost, simplicity of design, fool-proof operation and compactness. The entire unit can be mounted in a small carrying case, which can be picked up and moved from place to place easily.

The tubes used in this unit are a 6A6 and a type 42. These tubes, by means of a switching arrangement, shown in the circuit diagram, function as oscillator and modulator for the transmitter, and detector and amplifier when used as a receiver.

Since the batteries will in all probability be contained in

the same case as the transceiver the unit is ready for operation at a moment's notice by simply turning on the switch.

The actual constructional lay-out of this unit is left to the individual constructor, since there are no stringent requirements as to lay-out of parts, etc. The only requirement is that all wires be kept as short as possible and that all mounting and wiring be done in a neat and workmanlike manner. This is necessary in a portable as it is often subjected to severe abuse.

The antenna for 5 meter operation can be either a vertical rod, or a wire of suitable length elevated as high as possible.

USEFUL RADIO DATA

Ohms Law for D.C.

$$E = I \times R = \sqrt{PR} = \frac{P}{I} = \frac{I}{G}$$

$$I = \frac{E}{R} = \sqrt{\frac{P}{R}} = \frac{P}{E} = EG$$

$$R = \frac{E}{I} = \frac{E^2}{P} = \frac{P}{I^2} = \frac{I}{G}$$

$$G = \frac{I}{E} = \frac{I^2}{P} = \frac{P}{E^2} = \frac{I}{R}$$

Where

E = Voltage
I = Current — Amperes
R = Resistance — ohms
P = Power — watts
G = Conductance — mhos

Ohms Law for A.C.

$$X = \frac{E}{I}, \quad E = IX, \quad 1 = \frac{E}{X}$$

$$Xc = \frac{1}{2\pi FC}, \quad XI = 2\pi FL$$

$$Z = \sqrt{R^2 + X^2} = \sqrt{R^2 + (XL - Xc)^2}$$

$$\text{Or } Z = \sqrt{R^2 + \left(2\pi FL - \frac{1}{2\pi FC}\right)^2}$$

$$\text{Or } Z = \frac{E}{I}, \quad E = IZ, \quad 1 = \frac{E}{Z}$$

$$I = \frac{E}{\sqrt{X^2 + R^2}}, \quad E = I\sqrt{X^2 + R^2}$$

$$I = \frac{E}{\sqrt{(XL - XC)^2 + R^2}}$$

$$E = I\sqrt{(XL - Xc)^2 + R^2}$$

Where

X = Reactance — ohms
Xc = Capacitive reactance — ohms
XL = Inductive reactance — ohms
Z = Impedance — ohms
R = Resistance — ohms
L = Inductance in henries
C = Capacity in farads
F = Frequency — cycles per second
$2\pi = 6.28$

Resistor Formula

$$Rt = \frac{R_1 \times R_2}{R_1 + R_2} \text{ for two resistors}$$

$$R_1 = \frac{RtR_2}{R_2 - Rt}, \quad R_2 = \frac{RtR_1}{R_1 - Rt}$$

For three or more resistors

$$Rt = \frac{1}{\frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} + \frac{1}{R_4}, \text{ etc.}}$$

Resistors in Series = $R_1 + R_2 + R_3$ etc.
Resistors in Parellel —
Rt = Total resistance
R_1 = One value of R
R_2 = Another value of R

Condenser Formula

Ct = Total Capacity

For Condensers in parallel

$$Ct = C_1 + C_2 + C_3, \text{ etc.}$$

For Condensers in Series

$$Ct \text{ for two condensers} = \frac{C_1 C_2}{C_1 + C_2}$$

$$C_1 = \frac{CtC_2}{C_2 - Ct}, \quad C_2 = \frac{CtC_1}{C_1 - Ct}$$

Ct for three or more =

$$\frac{1}{\frac{1}{C_1} + \frac{1}{C_2} + \frac{1}{C_3}, \text{ etc.}}$$

Equivalent Series Resistance of Shunt Resistance Across a Condenser

The effect of a high value of resistance connected across a condenser may be resolved into the effect of a resistance connected in series with the condenser by means of the following equation in which "r" is the shunt resistance and "R" is the equivalent series resistance.

$$R = \frac{1}{(6.28f)^2 \times C^2 \times r}$$

Resonance Formula

Formulas —
F = Frequency in Kilocycles
L = Inductance in Microhenries
C = Capacity in Microfarads

$$F^2 = \frac{25330}{LC} \quad L = \frac{25330}{F^2 C} \quad C = \frac{25330}{F^2 L}$$

Gain of Amplifier Stage

G = Gain
Mu = Amplification factor
RI = Plate load
Rp = Internal A.C. plate resistance of tube

$$G = Mu \frac{RI}{RI + Rp}$$

Impedance of resistor and either capacitive or inductive reactance in parallel.

$$Z = \sqrt{\frac{XR}{R^2 + X^2}}$$

If R and Z are known —

$$X = \frac{ZR}{\sqrt{R^2 - Z^2}}$$

If Z and X are known —

$$R = \frac{XZ}{\sqrt{X^2 - Z^2}}$$

A.C. Current and Voltage Relationships

$$E_{max} = E_{eff} \times 1.414 = E_{ave} \times 1.57$$
$$E_{eff} = E_{max} \times .707 = E_{ave} \times 1.11$$
$$E_{ave} = E_{max} \times .636 = E_{eff} \times .9$$

Sharpness of Resonance

The ratio between the inductive reactance of a coil and its effective resistance gives a measure of efficiency known as the "Q".

$$Q = \frac{6.28 \times f \times L}{R}$$

Frequency — Wavelength Conversion

To convert frequency in cycles to wavelength in meters.

$$\text{Wavelength in Meters} = \frac{299,820,000}{f}$$

To convert wavelength in meters to frequency in cycles.

$$\text{Frequency in Cycles} = \frac{299,820,000}{\text{Wavelength in Meters}}$$

USEFUL RADIO DATA

Inductance Calculations

The inductance of single-layer coils for transmitters and receivers are easy to calculate from the following formula:

$$L = \frac{0.2\,A^2\,N^2}{3A + 9B}$$

where L is the inductance in microhenrys

A is the mean diameter of the coil in inches

B is the length of winding in inches

N is the number of turns.

To determine the numbers of turns of a single layer coil:

$$N = \sqrt{\frac{3A + 9B}{0.2A^2} \times L}$$

The Greek Alphabet

Various letters of the Greek alphabet appear constantly in radio formulae, charts, and diagrams.

Here is the whole alphabet for handy reference. The first column shows the capital letters, the next one the small letters.

HARMONIC OPERATION MULTI-BAND ANTENNAE

Contrary to general conception harmonic type multi-band antenna systems do not resonate on integral harmonics.

The table shown below gives the frequencies at which different antenna lengths resonate at various harmonics.

Length	½ Wave	Fundamental	2nd	Harmonics 4th	8th	Length	½ Wave	Fundamental	2nd	Harmonics 4th	8th
133' 6"	3,500	7,185	14,550	29,210	58,760	65'10"	7,100	14,570	29,510	59,290

AMATEUR CALL AREAS IN THE UNITED STATES

Call area	State	County
W-1	Connecticut	All counties.
	Maine	All counties.
	Massachusetts	All counties.
	New Hampshire	All counties.
	Rhode Island	All counties.
	Vermont	All counties.
W-2	New Jersey	Bergen, Essex, Hudson, Middlesex, Monmouth, Ocean, Passaic, and Union.
	New York	Albany, Bronx, Columbia, Dutchess, Greene, Kings, Nassau, New York, Orange, Putnam, Queens, Rensselaer, Richmond, Rockland, Schenectady, Suffolk, Ulster, and Westchester.
W-3	Delaware	All counties.
	District of Columbia	All counties.
	Maryland	All counties.
	New Jersey	Atlantic, Burlington, Camden, Cape May, Cumberland, Gloucester, Hunterdon, Mercer, Morris, Salem, Somerset, Sussex, and Warren.
	Pennsylvania	Adams, Berks, Bucks, Chester, Cumberland, Dauphin, Delaware, Franklin, Lancaster, Lebanon, Lehigh, Montgomery, Northampton, Philadelphia, and York.
	Virginia	All counties.
W-4	Alabama	All counties.
	Florida	All counties.
	Georgia	All counties.
	North Carolina	All counties.
	Puerto Rico	All counties.
	South Carolina	All counties.
	Tennessee	All counties.
	Virgin Islands	All counties.
W-5	Arkansas	All counties.
	Louisiana	All counties.
	Mississippi	All counties.
	New Mexico	All counties.
	Oklahoma	All counties.
	Texas	All counties.
W-6	Arizona	All counties.
	California	All counties.
	Hawaii	All counties.
	Nevada	All counties.
	Utah	All counties.
W-7	Alaska	All counties.
	Idaho	All counties.
	Montana	All counties.
	Oregon	All counties.
	Washington	All counties.
	Wyoming	All counties.
W-8	Michigan	Alcona, Allegan, Alpena, Antrim, Arenac, Barry, Bay, Benzie, Berrien, Branch, Calhoun, Cass, Charlevoix, Cheboygan, Clare, Clinton, Crawford, Eaton, Emmet, Genesee, Gladwin, Grand, Traverse, Gratiot, Hillsdale, Huron, Ingham, Ionia, Iosca, Isabella, Jackson, Kalamazoo, Kalkaska, Kent, Lake, Lapeer, Leelanau, Lenaween, Livingston, Macomb, Manistee, Mason, Mecosta, Midland, Missaukee, Monroe, Montcalm, Montmorency, Muskegon, Newaygo, Oakland, Oceana, Ogemau, Osceola, Oscoda, Otsego, Ottawa, Presque, Isle, Roscommon, St. Clair, St. Joseph, Saginaw, Sanilac, Shawassee, Tuscola, Van Buren, Washtenaw, Wayne, and Wexford.
	New York	Allegany, Broome, Cattaraugus, Cayuga, Chautauqua, Chemung, Chenango, Clinton, Cortland, Delaware, Erie, Essex, Franklin, Fulton, Genessee, Hamilton, Herkimer, Jefferson, Lewis, Livingston, Madison, Monroe, Montgomery, Niagara, Oneida, Onondaga, Ontario, Orleans, Oswego, Otsego, St. Lawrence, Saratoga, Schoharie, Schuyler, Seneca, Steuben, Sullivan, Tioga, Tompkins, Warren, Washington, Wayne, Wyoming, and Yates.
	Ohio	All counties.
	Pennsylvania	Allegheny, Armstrong, Beaver, Bedford, Blair, Bradford, Butler, Cambria, Cameron, Carbon, Center, Clarion, Clearfield, Clinton, Columbia, Crawford, Elk, Erie, Fayette, Forest, Fulton, Greene, Huntingdon, Indiana, Jefferson, Juniata, Lackawanna, Lawrence, Luzerne, Lycoming, McKean, Mercer, Mifflin, Monroe, Montour, Northumberland, Perry, Pike, Potter, Schuylkill, Snyder, Somerset, Sullivan, Susquehanna, Tioga, Union, Venango, Warren, Washington, Wayne, Westmoreland, and Wyoming.
	West Virginia	All counties.
W-9	Colorado	All counties.
	Illinois	All counties.
	Indiana	All counties.
	Iowa	All counties.
	Kansas	All counties.
	Kentucky	All counties.
	Michigan	Alger, Baraga, Chippewa, Delta, Dickinson, Gogebic, Houghton, Iron, Keweenaw, Luce, Mackinac, Marquette, Menominee, Ontonagon, and Schoolcraft.
	Minnesota	All counties.
	Missouri	All counties.
	Nebraska	All counties.
	North Dakota	All counties.
	South Dakota	All counties.
	Wisconsin	All counties.

These call areas should not be confused with the United States Radio Districts.

SIGNAL STRENGTH REPORTS
THE "QSA-R" SYSTEM

"Q" READABILITY SYSTEM

QSA1—HARDLY PERCEPTIBLE; UNREADABLE.
QSA2—WEAK; READABLE ONLY NOW AND THEN.
QSA3—FAIRLY GOOD; READABLE WITH DIFFICULTY.
QSA4—GOOD READABLE SIGNALS.
QSA5—VERY GOOD SIGNALS; PERFECTLY READABLE.

"R" AUDIBILITY SYSTEM

R1—FAINT SIGNALS; JUST READABLE.
R2—WEAK SIGNALS; BARELY READABLE.
R3—WEAK SIGNALS; BUT CAN BE COPIED.
R4—FAIR SIGNALS; EASILY READABLE.
R5—MODERATELY STRONG SIGNALS.
R6—GOOD SIGNALS.

R7—GOOD STRONG SIGNALS, THAT COME TRRU QRM & QRN.
R8—VERY STRONG SIGNALS; HEARD SEVERAL FEET FROM THE FONES.
R9—EXTREMELY STRONG SIGNALS.

"T" TONE SYSTEM

T1—("T3, R6,") VERY BAD 25 OR 60 CYCLE AC TONE.
T2—ROUGH 60 CY AC TONE.
T3—POOR RAC TONE. SOUNDS LIKE NO FILTER.
T4—FAIR RAC, SMALL FILTER.
T5—NEARLY DC TONE, GOOD FILTER, BUT HAS KEY THUMPS, OR BACK WAVE, ETC.
T6—NEARLY DC TONE. VERY GOOD FILTER; KEYING OK.
T7—PURE DC TONE, BUT HAS KEY THUMPS, BACK WAVE, ETC.
T8—PURE DC, NOT EQUAL TO T9.
T9—BEST STEADY, PURE CRYSTAL CONTROLLED DC TONE.

THE "R-S-T" SYSTEM

READABILITY	SIGNAL STRENGTH		TONE	
1—NOT READABLE	1—VERY FAINT	6—GOOD	1—VERY ROUGH	5—SLIGHT AC NOTE
2—BARELY READABLE	2—VERY WEAK	7—MODERATELY STRONG	2—ROUGH AC NOTE	6—MODULATED, SLIGHT WHISTLE
3—READABLE WITH DIFFICULTY	3—WEAK	8—STRONG	3—FAIRLY ROUGH AC	7—NEARLY DC NOTE
4—EASILY READABLE	4—FAIR	9—VERY STRONG	4—RATHER ROUGH	8—GOOD DC NOTE
5—PERFECTLY READABLE	5—FAIRLY GOOD		MUSICAL AC NOTE	9—PURE DC NOTE

Alphabetical Word List for Accurate Transmission

A — ADAMS	J — JOHN	S — SUGAR
B — BOSTON	K — KING	T — THOMAS
C — CHICAGO	L — LINCOLN	U — UNION
D — DENVER	M — MARY	V — VICTOR
E — EDWARD	N — NEW YORK	W — WILLIAM
F — FRANK	O — OCEAN	X — X-RAY
G — GEORGE	P — PETER	Y — YOUNG
H — HENRY	Q — QUEEN	Z — ZERO
I — IDA	R — ROBERT	

Radiophone stations when sending messages containing initials or station call letters should use the above list to avoid errors.
Example: W2ADX is sent as WILLIAM TWO ADAM DENVER X-RAY.

U. S. Postal Rates on Q. S. L. Cards and Letters

LETTERS, 3c each ounce or fraction to United States, U. S. Possessions, Canada, Labrador and Newfoundland. 2c each ounce or fraction if for delivery in the town in U. S. where letter was mailed. AIRMAIL to U. S. and Canada: 6c each ounce or fraction.

LETTERS, 3c each ounce or fraction, CARDS 2c, to: Argentina, Balearic Islands, Bolivia, Brazil, Canary Islands, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, Guatemala, Haiti, Honduras, Mexico, Morocco (Spanish), Nicaragua, Panama, Paraguay, Peru, Salvador, Spain and its Colonies, Uruguay, Venezuela.

LETTERS, 3c each ounce or fraction to Canada, Labrador, and Newfoundland. Letters 5c each ounce or fraction to Great Britain.

LETTERS, 5c first ounce and 3c for each additional ounce or fraction to: All other countries not in the above lists.

POST CARDS, 1c each in United States and Possessions, and 2c to countries taking 3c letter rate.

All other foreign countries, 3c each.

METHODS OF COUPLING TO THE TRANSMITTER

The various methods of coupling the antenna to the transmitter are shown in the schematics shown below. Each circuit shown, if properly adjusted can be made to give exceptionally good results. Which type you use is a matter of individual choice depending upon whether the final amplifier utilizes a split or unsplit tank circuit. The first nine methods show the more common systems of capacitative coupling. The others use inductive coupling which include the popular link systems that permit the antenna tuning controls to be placed at a distance from the transmitter final.
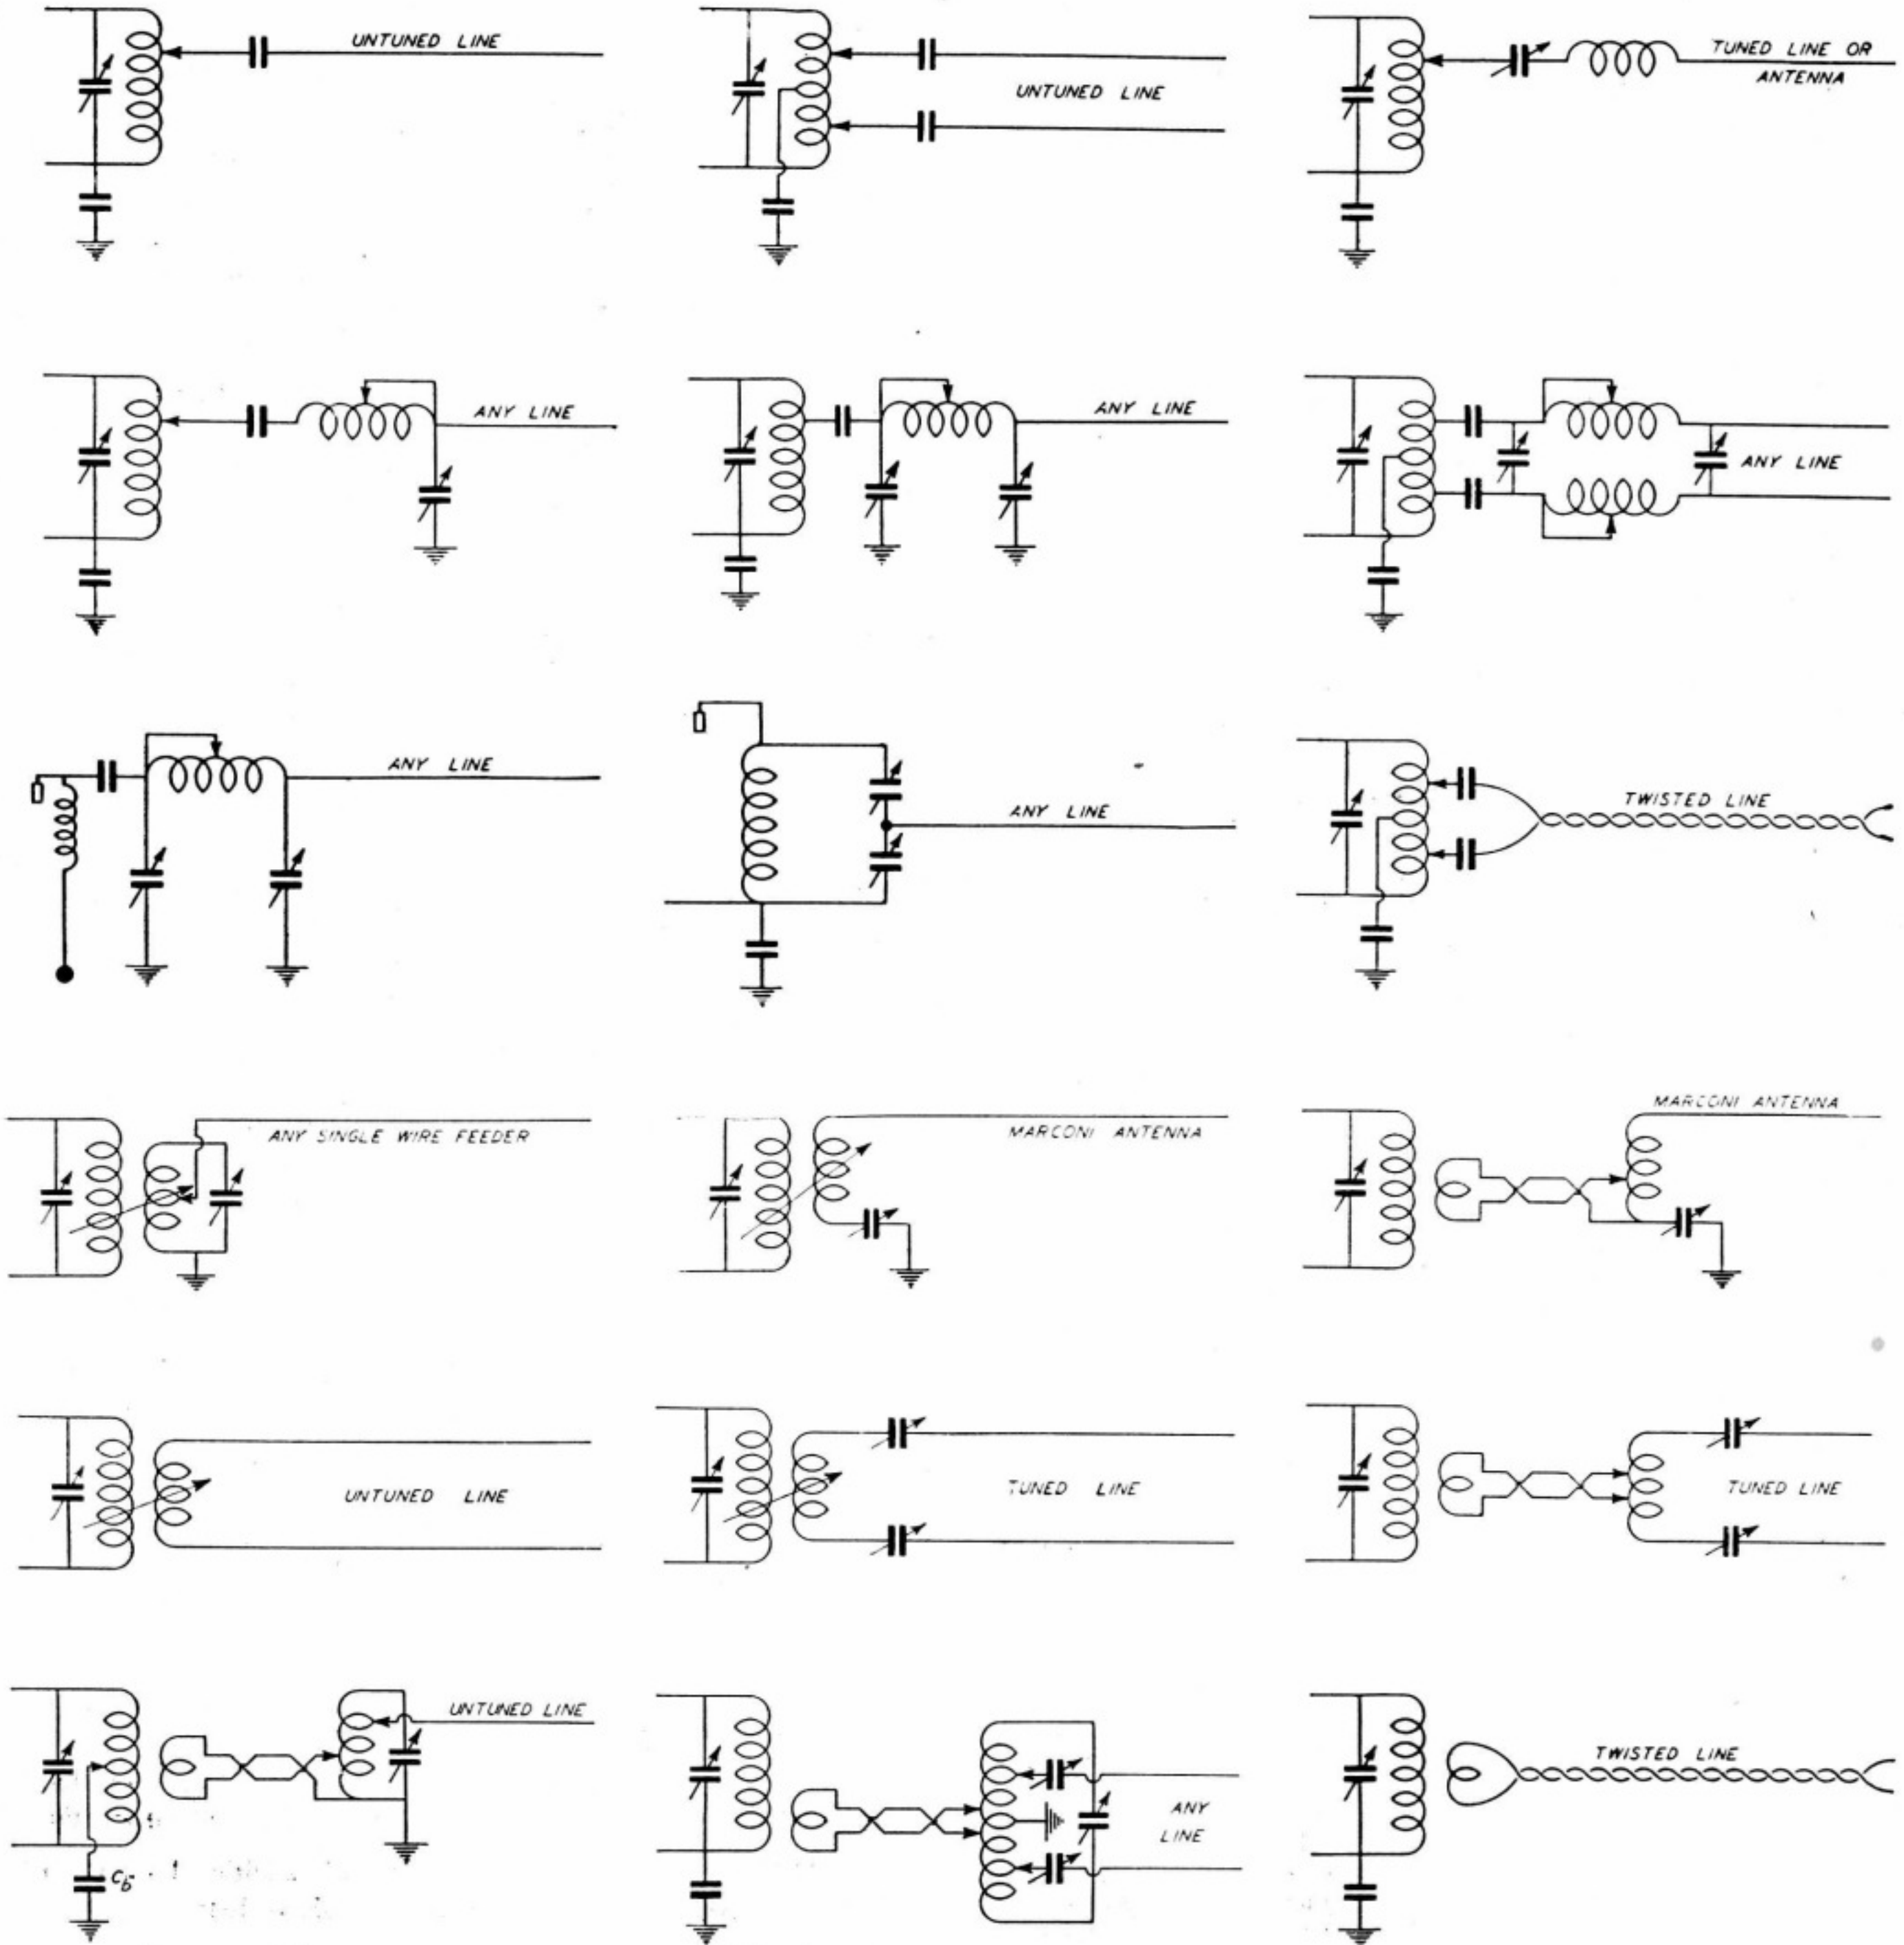

FEDERAL COMMUNICATIONS COMMISSION
RULES FOR AMATEUR OPERATORS AND STATIONS

The following excerpts from the Commission's rules include all that deal solely with the amateur service and certain others that apply generally.

24. *Answering notice of violation.*—Any licensee receiving official notice of a violation of Federal laws, the Commission's rules and regulations, or the terms and conditions of a license shall, within 3 days from such receipt, send a written reply direct to the Federal Communications Commission at Washington, D. C. The answer to each notice shall be complete in itself and shall not be abbreviated by reference to other communications or answers to other notices. If the notice relates to some violation that may be due to the physical or electrical characteristics of the transmitting apparatus, the answer shall state fully what steps, if any, are taken to prevent future violations, and if any new apparatus is to be installed, the date such apparatus was ordered, the name of the manufacturer, and promised date of delivery.

26. If the notice of violation relates to some lack of attention or improper operation of the transmitter, the name and license number of the operator in charge shall be given.

27. *Normal license periods.*—All station licenses will be issued so as to expire at the hour of 3 a. m. eastern standard time.

e. The licenses for amateur stations will be issued for a normal license period of 3 years from the date of expiration of old license or the date of granting a new license or modification of a license.

188. *Station.*—The term "station" means all of the radio-transmitting apparatus used at a particular location for one class of service and operated under a single instrument of authorization. In the case of every station other than broadcast, the location of the station shall be considered as that of the radiating antenna.

189. *Mobile station.*—The term "mobile station" means a station that is capable of being moved and ordinarily does move.

190. *Fixed station.*—The term "fixed station" means a station, other than an amateur station, not capable of being moved, and communicating by radio with one or more stations similarly established.

191. *Land station.*—The term "land station" means a station not capable of being moved, carrying on a mobile service.

192. *Portable station.*—The term "portable station" means a station so constructed that it may conveniently be moved about from place to place for communication and that is in fact so moved about from time to time, but not used while in motion.

a. Portable-mobile station.—The term "portable-mobile station" means a station so constructed that it may conveniently be moved from one mobile unit to another for communication, and that is, in fact, so moved about from time to time and ordinarily used while in motion.

193. *Mobile service.*—The term "mobile service" means a radio-communication service carried on between mobile and land stations and by mobile stations, communicating among themselves, special services being excluded.

194. *Fixed service.*—The term "fixed service" means a service carrying on radio-communication of any kind between fixed points, excluding broadcasting services and special services.

209. *Damped waves.*—Except for ship stations under the conditions hereinafter specified, no license will be issued for the operation of any station using or proposing to use, transmitting apparatus employing damped wave emissions.

210. *Distress messages.*—Radio communications or signals relating to ships or aircraft in distress shall be given absolute priority. Upon notice from any station, Government or commercial, all other transmissions shall cease on such frequencies and for such time as may, in any way, interfere with the reception of distress signals or related traffic.

211. No station shall resume operation until the need for distress traffic no longer exists, or it is determined that said station will not interfere with distress traffic as it is then being routed and said station shall again discontinue if the routing of distress traffic is so changed that said station will interfere. The status of distress traffic may be ascertained by communication with Government and commercial stations.

214. *Licensed operator required.*—Only an operator holding a radiotelegraph class of operators' license may manipulate the transmitting key of a manually operated coastal telegraph or mobile telegraph station in the international service; and only a licensed amateur operator may manipulate the transmitting key at a manually operated amateur station. The licensees of other stations operated under the constant supervision of duly licensed operators may permit any person or persons, whether licensed or not, to transmit by voice or otherwise, in accordance with the types of emission specified by the respective licenses.

221. *Licenses, posting of.*—In the case of amateur, portable, and portable-mobile stations the original license, or a photostat copy thereof, shall be similarly posted or kept in the personal possession of the operator on duty.

In the case of an amateur or aircraft radio operator, and operators of portable or portable-mobile stations, the original operator's license shall be similarly posted or kept in his personal possession and available for inspection at all times while the operator is on duty.

b. When an operator's license cannot be posted because it has been mailed to an office of the Federal Communications Commission for endorsement or other change, such operator may continue to operate stations in accordance with the class of license

held, for a period not to exceed 60 days, but in no case beyond the date of expiration of the license.

362. *Definition, amateur station.*—The term "amateur station" means a station used by an "amateur," that is, a duly authorized person interested in radio technique solely with a personal aim and without pecuniary interest.

364. *Definition, amateur operator.*—The term "amateur radio operator" means a person holding a valid license issued by the Federal Communications Commission who is authorized under the regulations to operate amateur radio stations.

365. *Definition, amateur radio communication.*—The term "amateur radio communication" means radio communication between amateur radio stations solely with a personal aim and without pecuniary interest.

366. *Station licenses.*—An amateur station license may be issued only to a licensed amateur radio operator who has made a satisfactory showing of ownership or control of proper transmitting apparatus: Provided, however, That in the case of a military or naval reserve radio station located in approved public quarters and established for training purposes, but not operated by the United States Government, a station license may be issued to the person in charge of such station who may not possess an amateur operator's license.

a. Operator's license.—An amateur operator's license may be granted to a person who does not desire an amateur station license, provided such applicant waives his right to apply for an amateur station license for 90 days subsequent to the date of application for operator's license.

367. *Eligibility for license.*—Amateur radio station licenses shall not be issued to corporations, associations, or other organizations: Provided, however, That in the case of a bona fide amateur radio society a station license may be issued to a licensed amateur radio operator as trustee for such society.

368. *Mobile stations.*—Licenses for mobile stations and portable-mobile stations will not be granted to amateurs for operation on frequencies below 28,000 kilocycles. However, the licensee of a fixed amateur station may operate portable amateur stations (rule 192) in accordance with the provisions of rules 384, 386, and 387; and also portable and portable-mobile amateur stations (rules 192 and 192a) on authorized amateur frequencies above 28,000 kilocycles in accordance with rules 384 and 386, but without regard to rule 387.

370. *Points of communication.*—Amateur stations shall be used only for amateur service, except that emergencies or for testing purposes they may be used also for communication with commercial or Government radio stations. In addition, amateur stations may communicate with any mobile radio station which is licensed by the Commission to communicate with amateur stations, and with stations of expeditions

which may also be authorized to communicate with amateur stations.

371. *Amateur stations not to be used for broadcasting.*—Amateur stations shall not be used for broadcasting any form of entertainment, nor for the simultaneous retransmission by automatic means of programs or signals emanating from any class of station other than amateur.

372. *Radiotelephone tests.*—Amateur stations may be used for the transmission of music for test purposes of short duration in connection with the development of experimental radiotelephone equipment.

373. *Amateur stations not for hire.*—Amateur radio stations shall not be used to transmit or receive messages for hire, nor for communication for material compensation, direct or indirect, paid or promised.

374. The following bands of frequencies are allocated exclusively for use by amateurs:

1,715 to	2,000 kilocycles
3,500 to	4,000 kilocycles
7,000 to	7,300 kilocycles
14,000 to	14,400 kilocycles
28,000 to	30,000 kilocycles
56,000 to	60,000 kilocycles
400,000 to	401,000 kilocycles

a. The licensee of an amateur station may, subject to change upon further order, operate amateur stations on any frequency above 110,000 kilocycles, without separate licenses therefor, provided:

(1) That such operation in every respect complies with the Commission's rules governing the operation of amateur stations in the amateur service.

(2) That records are maintained of all transmissions in accordance with the provisions of rule 386.

375. *Types of emission.*—All bands of frequencies so assigned may be used for radiotelegraphy, type A-1 emission. Type A-2 emission may be used in the following bands of frequencies only:

28,000 to	30,000 kilocycles
56,000 to	60,000 kilocycles
400,000 to	401,000 kilocycles

376. *Frequency band for telephony.*—The following bands of frequencies are allocated for use by amateur stations using radio-telephony, type A-3 emission:

1,800 to	2,000 kilocycles
28,000 to	29,000 kilocycles
56,000 to	60,000 kilocycles
400,000 to	401,000 kilocycles

377. *Additional bands for telephony.*—Provided the station shall be operated by a person who holds an amateur operator's license endorsed for class A privileges, an amateur radio station may use radiotelephony, type A-3 emission, in the following additional bands of frequencies:

3,900 to	4,000 kilocycles
14,150 to	14,250 kilocycles

378. *Amateur television, facsimile, and picture transmission.*—The following bands of frequencies are allocated for use by amateur stations for television, facsimile, and picture transmission:

1,715 to	2,000 kilocycles
56,000 to	60,000 kilocycles

379. *Licenses will not specify individual frequencies.*—Transmissions by an amateur station may be on any frequency within an amateur band above assigned.

380. *Aliens.*—An amateur radio station shall not be located upon premises controlled by an alien.

381. *Prevention of interference.*—Spurious radiations from an amateur transmitter operating on a frequency below 30,000 kilocycles shall be reduced or eliminated in accordance with good engineering practice and shall not be of sufficient intensity to cause interference on receiving sets of modern design which are tuned outside the frequency band of emission normally required for the type of emission employed. In the case of A-3 emission, the transmitter shall not be modulated in excess of its modulation capability to the extent that interfering spurious radiations occur, and in no case shall the emitted carrier be amplitude-modulated in excess of 100 per cent. Means shall be employed to insure that the transmitter is not modulated in excess of its modulation capability. A spurious radiation is any radiation from a transmitter which is outside the frequency band of emission normal for the type of transmission employed, including any component whose frequency is an integral multiple or sub-multiple of the carrier frequency (harmonics and sub-harmonics) spurious modulation products, key clicks and other transient effects, and parasitic oscillations.

382. *Power supply to transmitter.*—Licensees of amateur stations using frequencies below 30,000 kilocycles shall use adequately filtered direct-current power supply for the transmitting equipment to minimize frequency modulation and to prevent the emission of broad signals.

383. *Authorized power.*—Licensees of amateur stations are authorized to use a maximum power input of 1 kilowatt to the plate circuit of the final amplifier stage of an oscillator-amplifier transmitter or to the plate circuit of an oscillator transmitter.

384. *Transmission of call.*—An operator of an amateur station shall transmit its assigned call at least once during each 15 minutes of operation and at the end of each transmission. In addition, an operator of an amateur portable-mobile radiotelegraph station shall transmit immediately after the call of the station the break sign (BT) followed by the number of the amateur call area in which the portable or portable-mobile amateur station is then operating as for example:

Example 1. Portable or portable-mobile amateur station operating in the third amateur call area calls a fixed amateur station: W1ABC W1ABC W1ABC DE W2DEF BT3 W2DEF BT3 W2DEF BT3 AR.

Example 2. Fixed amateur station answers the portable or portable-mobile amateur station: W2DEF W2DEF W2DEF DE W1ABC W1ABC W1ABC K.

Example 3. Portable or portable-mobile amateur station calls a portable or portable-mobile amateur station: W3GHI W3GHI W3GHI DE W4JKL BT4 W4JKL BT4 W4JKL BT4 AR.

If telephony is used, the call sign of the station shall be followed by an announcement of the amateur call area in which the portable or portable-mobile station is operating.

a. In the case of an amateur licensee whose station is licensed to a regularly commissioned or enlisted member of the United States Naval Reserve, the commandant of the naval district in which such reservist resides may authorize in his discretion the use of the call-letter prefix N in lieu of the prefix W or K, assigned in the license issued by the Commission, provided that such N prefix shall be used only when operating in the frequency bands 1,715-2,000 kilocycles and 3,500-4,000 kilocycles in accordance with instructions to be issued by the Navy Department.

385. *Quiet hours.*—In the event that the operation of an amateur radio station causes general interference to the reception of broadcast programs with receivers of modern design, that amateur station shall not operate during the hours from 8 o'clock p. m. to 10:30 p. m., local time, and on Sunday from 10:30 a. m. until 1 p. m., local time, upon such frequency or frequencies as cause such interference.

386. *Logs.*—Each licensee of an amateur station shall keep an accurate log of station operation to be made available upon request by authorized Government representatives, as follows:

a. The date and time of each transmission. (The date need only be entered once for each day's operation. The expression "time of each transmission" means the time for making a call and need not be repeated during the sequence of communication which immediately follows; however, an entry shall be made in the log when "signing off" so as to show the period during which communication was carried on.)

b. The name of the person manipulating the transmitting key of a radiotelegraph transmitter or the name of the person operating a transmitter of any other type (type A-3 or A-4 emission) with statement as to type of emission. (The name need only be entered once in the log provided the log contains a statement to the effect that all transmissions were made by the person named except where otherwise stated. The name of any other person who operates the station shall be entered in the proper space for his transmissions.)

c. Call letters of the station called. (This entry need not be repeated for calls made to the same station during any sequence of communication, provided the time of "signing off" is given.)

d. The input power to the oscillator, or to the final amplifier stage where an oscillator-amplifier transmitter is employed. (This need be entered only once, provided the input power is not changed.)

e. The frequency band used. (This information need be entered only once in the log for all transmissions until there is a change in frequency to another amateur band.)

f. The location of a portable or portable-mobile station at the time of each transmis-

sion. (This need be entered only once, provided the location of the station is not changed. However, suitable entry shall be made in the log upon changing location, showing the type of vehicle or mobile unit in which the station is operated and the approximate geographical location of the station at the time of operation.)

g. The message traffic handled. (If record communications are handled in regular message form, a copy of each message sent and received shall be entered in the log or retained on file for at least 1 year.)

387. *Portable stations.* — Advance notice of all locations in which portable amateur stations will be operated shall be given by the licensee to the inspector in charge of the district in which the station is to be operated. Such notices shall be made by letter or other means prior to any operation contemplated and shall state the station call, name of licensee, the date of proposed operation, and the approximate locations, as by city, town, or county. An amateur station operating under this rule shall not be operated during any period exceeding 30 days without giving further notice to the inspector in charge of the radio inspection district in which the station will be operated. This rule does not apply to the operation of portable or portable-mobile amateur stations on frequencies above 28,000 kc. authorized to be used by amateur stations (see rule 368).

400. *Only amateur operators may operate amateur stations.* — An amateur station may be operated only by a person holding a valid amateur operator's license, and then only to the extent provided for by the class of privileges for which the operator's license is endorsed.

401. *Validity of operator's license.* — Amateur operators' licenses are valid only for the operation of licensed amateur stations, provided, however, any person holding a valid radio operator's license of any class may operate stations in the experimental service licensed for, and operating on, frequencies above 30,000 kilocycles.

402. *Proof of use.* — Amateur station licenses and/or amateur operator licenses may, upon proper application, be renewed provided: (1) The applicant has used his station to communicate by radio with at least three other amateur stations during the 3-month period prior to the date of submitting the application, or (2) in the case of an applicant possessing only an operator's license, that he has similarly communicated with amateur stations during the same period. Proof of such communication must be included in the application by stating the call letters of the stations with which communication was carried on and the time and date of each communication. Lacking such proof, the applicant will be ineligible for a license for a period of 90 days.

This rule shall not prevent renewal of an amateur station license to an applicant who has recently qualified for license as an amateur operator.

403. *Class of operator and privileges.* — There shall be but one main class of amateur operator's license, to be known as "amateur class," but each such license shall be limited in scope by the signature of the examining officer opposite the particular class or classes of privileges which apply, as follows:

Class A. — Unlimited privileges.

Class B. — Unlimited radiotelegraph privileges. Limited in the operation of radiotelephone amateur stations to the following bands of frequencies: 1,800 to 2,000 kilocycles; 28,000 to 28,500 kilocycles; 56,000 to 60,000 kilocycles; 400,000 to 401,000 kilocycles.

Class C. — Same as class B privileges, except that the Commission may require the licensee to appear at an examining point for a supervisory written examination and practical code test during the license term. Failing to appear for examination when directed to do so, or failing to pass the supervisory examination, the license held will be canceled and the holder thereof will not be issued another license for the class C privileges.

404. *Scope and places of examinations.* — The scope of examinations for amateur operators' licenses shall be based on the class of privileges the applicant desires, as follows:

Class A. — To be eligible for examination for the class A amateur operator's privileges the applicant must have been a licensed amateur operator for at least 1 year and must personally appear at one of the Commission's examining offices, and take the supervisory written examination and code test. Examinations will be conducted at Washington, D. C., on Thursday of each week, and at each radio district office of the Commission on the days designated by the inspector in charge of such office. In addition examinations will be held quarterly in other examining cities on the dates to be designated by the inspector in charge of the radio district in which the examining city is situated. The examination will include the following:

a. Applicant's ability to send and receive in plain language messages in the Continental Morse Code (5 characters to the word) at a speed of not less than 13 words per minute.

b. Technical knowledge of amateur radio apparatus, both telegraph and telephone.

c. Knowledge of the provisions of the Communications Act of 1934, subsequent acts, treaties, and rules and regulations of the Federal Communications Commission, affecting amateur licensees.

Class B. — The requirements for class B amateur operators' privileges are similar to those for the class A, except that no experience is required and the questions on radio-telephone apparatus are not so comprehensive in scope.

Class C. — The requirements for class C amateur operators' privileges shall be the same as for the class B except the examination will be given by mail. Applicants for class C privileges must reside more than 125 miles airline from the nearest examining point for class B privileges, or in a camp of the Civilian Conservation Corps, or be in the regular military or naval service of the United States at a military post or naval station; or be shown by physician's certificate to be unable to appear for examination due to protracted disability.

405. *Recognition of other classes of licenses.* — An applicant for any class of amateur operator's privileges who has held a radiotelephone second-class operator's license or higher, or an equivalent commercial grade license, or who has been accorded unlimited amateur radiotelephone privileges, within 5 years of the date of application may only be required to submit additional proof as to code ability and/or knowledge of the laws, treaties, and regulations affecting amateur licensees.

406. An applicant for the class B or C amateur operator's privileges who has held a radiotelegraph third-class operator's license or higher, or an equivalent commercial grade license, or who has held an amateur extra first-class license within 5 years of the date of application may be accorded a license by passing an examination in laws, treaties, and regulations affecting amateur licensees.

407. *Code ability to be certified by licensed operator.* — An applicant for the class C amateur operator's privileges must have his application signed in the presence of a person authorized to administer oaths by (1) a licensed radiotelegraph operator other than an amateur operator possessing only the class C privileges or former temporary amateur class license, or (2) by a person who can show evidence of employment as a radiotelegraph operator in the Government service of the United States. In either case the radiotelegraph code examiner shall attest to the applicant's ability to send and receive messages in plain language in the continental Morse code (5 characters to the word) at a speed of not less than 13 words per minute. The code certification may be omitted if the applicant can show proof of code ability in accordance with the preceding rule.

408. *Application forms.* — Forms for amateur station and/or operator license shall be obtained by calling or writing to the inspector in charge of the radio inspection district in which the applicant resides. Upon completion of the forms, they shall be sent back to the same office where the final arrangements will be made for the examination: Provided, however, in the case of applicants for the class C amateur operator's privileges, the forms and examination papers when completed shall be mailed direct to the Federal Communications Commission, Washington, D. C.

409. *Grading of examination.* — The percentage that must be obtained as a passing mark in each examination is 75 out of a possible 100. No credit will be given in the grading of papers for experience or knowledge of the code. If an applicant answers only the questions relating to laws, treaties, and regulations, by reason of his right to omit other subjects because of having held a recognized class of license, a percentage of 75 out of a possible 100 must be obtained on the questions answered.

410. *Operator's and station licenses to run concurrently.* — An amateur station license shall be issued so as to run concurrently with the amateur operator's license and both licenses shall run for 3 years from the date of issuance. If either the station license or the operator's license is modified during the license term, both licenses shall be reissued for the full 3-year term: Pro-

vided, however, if an operator's license is modified only with respect to the class of operator's privileges, the old license may be endorsed, in which case the expiration date will not change.

411. *Eligibility for reexamination.*—No applicant who fails to qualify for an operator's license will be reexamined within 90 days from the date of the previous examination.

412. *Penalty.*—Any attempt to obtain an operator's license by fraudulent means, or by attempting to impersonate another, or copying or divulging questions used in examinations, or if found unqualified or unfit will constitute a violation of the regulations for which the licensee may suffer suspension of license or be refused a license and/or

debarment from further examination for a period not exceeding 2 years at the discretion of the licensing authority.

413. *Duplicate licenses.*—Any licensee applying for a duplicate license to replace an original which has been lost, mutilated, or destroyed, shall submit an affidavit to the Commission attesting to the facts regarding the manner in which the original was lost. Duplicates will be issued in exact conformity with the original, and will be marked "duplicate" on the face of the license.

414. *Oath of secrecy.*—Licenses are not valid until the oath of secrecy has been executed and the signature of the licensee affixed thereto.

415. *Examination to be written in longhand.*—All examinations, including the code test, must be written in longhand by the applicant.

RMA COLOR CODE

It is not generally known but the color code used by all manufacturers that are members of the Radio Manufacturers Association applies to fixed condensers as well as fixed resistors.

The code is the same for both and the units are ohms in the case of resistors and *micro-micro*-farads in the case of condensers.

Body Color		End Color		Dot Color	
Black	0	Black	0		
Brown	1	Brown	1	Brown	0
Red	2	Red	2	Red	00
Orange	3	Orange	3	Orange	000
Yellow	4	Yellow	4	Yellow	0000
Green	5	Green	5	Green	00000
Blue	6	Blue	6	Blue	000000
Purple	7	Purple	7	Purple	0000000
Gray	8	Gray	8	Gray	00000000
White	9	White	9	White	000000000

The body color is the first figure of the value.
The end color is the second figure of the value.
The center dot indicates the number of ciphers following the first two figures.

BIAS CALCULATIONS

Self-Bias

Self-bias is obtained by inserting a resistor in the cathode or center tap of the filament return and taking the necessary voltage drop across the resistor. To determine the value of grid bias simply divide the grid bias in volts by the plate current to obtain the resistance value in ohms.

$$\text{Ohms} = \frac{\text{grid bias} \times 1000}{\text{Plate current in milliamperes}}$$

Thus, for a 76 tube which has a plate current of 5 ma. for which a negative grid bias of 13.5 volts is required:

$$\frac{13.5 \text{ volts} \times 1000}{5} = 2700 \text{ ohms}$$

Class "C" Stage Bias

To determine the value of negative bias

for a Class "C" stage divide the plate voltage by the mu. or amplification factor of the tube and multiply by two for double cut-off. For higher efficiency and phone operation add 40 per cent to this figure. For example, a 203A tube is to be used Class "C" with 1250 volts on the plate. Amplification of this tube is 25. Therefore

$$\frac{1250}{25} = 50 \times 2 = 100 + 40 \ (40\%) = 140 \text{ volts}$$

Bias for Doubler Stage

The bias voltage for doubler stages is calculated similarly to Class "C" bias with the exception that the cut-off value is multiplied by 3. If the R-F excitation is sufficiently high, the bias may be increased with a resultant increase in output and efficiency.

Oscillator Bias

In amateur transmitter oscillator circuits the bias voltage is usually obtained from a grid leak. The bias is developed across the leak and is equal to the product of the d.c. grid current in amperes by the resistance of the grid leak in ohms. For example, if a grid current of 10 ma. is flowing through a 10,000 ohm grid leak the bias will be 0.010 amperes x 10,000 ohms, or 100 volts. In general, grid leak values are not critical. Lowering the ohmic value of the leak will increase the R-F output. Tubes with high mu's operate better with low ohmic values of grid leaks while low mu tubes may require leaks as high as 50,000 ohms.

KEN-O-GRAFS

The following 14 pages of Ken-O-Grafs have been designed to facilitate computing some of the common calculations encountered in amateur radio practice in a most painless modern method. The majority of these graphs are self explanatory with the exception of those described below:

The chart on page 44 permits the instantaneous determination of the frequency corresponding to any wavelength—or the wavelength equivalent of any frequency throughout the entire radio spectrum.

To find the frequency corresponding to any wavelength between 10.1 meters and 100 meters, or the wavelength equivalent of any frequency between 29,690 and 2,998, the chart may be read directly. Outside of this range the reading is made by shifting the decimal points. Thus, if one desires to find the frequency equivalent of 101 meters, for instance, shift the decimal point of the frequency one place to the left. This will show the frequency to be 2969 kc. If the frequency corresponding to 1010 meters is required, shift the wavelength decimal of the first item two places to the right and the frequency decimal two places in the opposite direction, and from this will be found that the required frequency is 296.9 kc.

Conversely, to find the wavelength corresponding to a given frequency, locate the number in the frequency column and read the wavelength in the opposite column. If it is necessary to move the decimal point in the frequency column, always move it in the wavelength column the same number of places, but in the opposite direction.

Where the frequency is shown in terms of megacycles, its equivalent in kilocycles is found by simply adding three ciphers to the megacycle figure.

The Ken-O-Graf on page 45 shows how to find the equivalent of two resistors in parallel and also the capacity of two condensers in series. Place a ruler through the division on arms marked "R1, C1 and R2, C2". The resultant line on RC will be the total resistance or capacity in the circuit.

On the next page will be found a similar chart to be used when the two branches are widely different.

The relation between inductance, capacity and frequency is shown on page 47. With this graph and a ruler any of the above mentioned quantities can be found if the other two are known. For example, what is the highest frequency obtainable when a 200 mmfd. condenser is used with a 13.5 microhenry coil? Lay a straight edge across 20 mmfd. on the capacity scale and 13.5 on the inductance scale; the intersection on the middle scale reads 3 megacycles. This chart can be employed in the same way if any two of three quantities are known.

For Ohms law and power consumed in the circuit the Ken-O-Graf shown on page 48 solves these equations with the aid of the straight edge. If any two quantities are known the other two can be found with the aid of a ruler or straight edge. For example, in a circuit of 2000 ohm resistance and a current of 10 milliamperes; what is the wattage and the voltage? The answer is found where the ruler intersects .2 on the watt scale and 20 on the voltage scale. It is essential when using this scale that all values be read on the A or B scale.

The graph shown on page 49 may be used to find:

(1) The reactance of a given inductance at a given frequency.

(2) The reactance of a given capacity at a given frequency.

(3) The resonant frequency of a given inductance and capacitance.

The sloping lines from lower left to upper right are associated with the inductances indicated along the upper and right hand edges. The lines slanting downward from the left to the right are associated with the capacities indicated along the upper and right hand edges. The reactance in ohms is shown on the left and the frequency at the foot of the chart.

To determine the reactance of a condenser or inductance at a certain frequency, follow along the vertical line corresponding to the proper frequency until it intersects the line corresponding to the specified capacity or inductance. The horizontal line which coincides with this intersection when carried to the left gives the value of reactance in ohms. For example, find the reactance of a coil having an inductance of 1 Henry at 1000 cycles. This value is found by referring to the vertical line corresponding to the 1000 cycles until its intersects the 1 Henry slanting line. The horizonal line at this point of intersection when carried to the left of the graph reads 6,200 ohms. Similarly, the sloping 1 mfd. line can be followed to the point where it intersects with the vertical 1000 cycle frequency line. Projecting from this point of intersection on the horizontal line indicates a reactance of 160 ohms.

To find the resonant frequency of a condenser and inductance, enter the slanting lines for the given inductance and capacity. At the point of intersection project vertically and read the frequency at the foot of the chart. For example, find the resonant frequency of a 1 mfd. condenser and a 1 Henry coil. Follow the sloping 1 mfd. line to the point where it intersects with the 1 Henry line. The vertical line through the point of intersection indicates a frequency of 160 cycles.

The chart shown on page 50 is designed to determine the wattage input to any tube or tubes and the load impedance which any modulated stage presents to the modulator. For example, a 150 T tube operated Class "C" at 1000 volts draws 200 milliamperes. What is the power input and the plate load resistance to be matched by the Class "B" modulator output transformer secondary? Place a ruler on the chart through 200 on the scale marked "Amplifier Plate Current" and 1000 on the scale marked "Amplifier D. C. Plate Voltage". Read 200 watts input on the scale marked "Amplifier Power Input" and 5000 ohms on the scale marked "Amplifier Plate D.C. Load Resistance".

KEN-O-GRAF

Proper attenuation of audio frequencies without introducing distortion is usually accomplished with pads. The Ken-O-Graf shown above gives resistance value of the branches of an "H" or "T" pad for channels having an impedance of 200 or 500 ohms. The range of attenuation is from 2 to 32 db.

OHMS-VOLTAGE — DECIBELS CONVERSION GRAPH
This graph may be used to find ohms, volts and level in decibels. e.g. **What is the level in decibels at 500 ohms at a voltage of 1 volt?** Enter the graph at the bottom (ohms) at 500 ohms and read up to where the slanting 1 volt line intersects. From this point, project horizontally to the left, and read —5 db. Based on .006 watts at zero level.

KEN-O-GRAF
## OHMS-CURRENT-DECIBELS CONVERSION GRAPH

This graph may be used to find ohms, current and level in decibels, e.g: *What is the level in decibels at 600 ohms at a current of 10 M.A.* Enter the graph at the bottom (ohms) at 600 ohms and read up to where the slanting 10 M.A. line intersects. From this point, project horizontally to the left, and read ±10 db

Based on .006 watts at zero level.

KEN-O-GRAF

EFFICIENCY VERSUS LOSS

PERCENT EFFICIENCY (vertical axis)

DECIBELS (horizontal axis)
Read Power Ratios Direct. Voltage and Current Ratios multiply db by 2.

THE DECIBEL OR DB

The decibel is used universally in radio engineering for the measurement of acoustic or electrical power ratios. This unit may be expressed mathematically as

$$db = 10 \ \log_{10} \ \frac{P_1}{P_2}$$

Thus it is seen the decibel so often used in the work of audio amplification, transmission, and reproduction, is simply the ratio between the strengths of any two signals, or the ratio of change in the energy of a signal when it is amplified or attenuated.

As used in amateur radio, the level in decibels is based upon a zero energy level of .006 watts (1.73 volts across a 500 ohm line). Zero levels of 12.5 mw and 1 mw are used in broadcast and telephone technique. All db references contained in this manual are based upon a zero energy level of 6 mw.

All levels above the reference or zero level are designated as plus db and below as minus db. In problems dealing with the conversion of voltage or current ratios the following expression is used.

$$db = 20 \ \log \ \frac{E_1}{E_2}$$

KEN-O-GRAF

DECIBELS BELOW OUTPUT

PERCENT OF OUTPUT

READ VOLTAGE OR CURRENT
LEVELS DIRECT
POWER LEVELS DIVIDE BY 2
This Ken-O-Graf is used to determine hum level, harmonic content, etc., in db below maximum output. Example: What is the hum level below output when the hum level is 1%. Read 40 db on the chart.

NOTE: Weights and resistances shown were calculated for wires of nominal diameter; hence, variations from these values may be expected. A mil is approximately 1000th part of one inch.

The Practical Solution To The Power Supply Problem

PROBABLY the biggest bug-a-boo in radio is the ever-existing menace of obsolescence. Of course, in such a modern industry new developments are constantly being born, and the older methods are soon discarded to make room for the later developments.

However, from the experimenter's point of view, obsolescence is quite expensive, especially when it involves the discarding of perfectly good equipment. New tubes are superior to existing types, but due to different voltages and circuit applications, changes in associated equipment are often necessary. In many instances the changes in r.f. and audio circuits are inexpensive. Moreover, a change in these circuits usually necessitates a change in the power supply. This is often the most expensive unit in the entire circuit, regardless of the application.

Universal Transformer

In transmitters or high-power public-address systems the low-power tubes require exceptionally good filtering to keep hum level as low as is consistent with good practice. If these low-level stages derive their voltage supply from the high-voltage system it is necessary to thoroughly filter the entire power supply, not only to eliminate hum but also to prevent feedback. Of course, this may be eliminated by filtering a small section that supplies only the lower level tubes. This method, however, jeopardizes condensers and resistors should the load be removed from this section.

Fig. 1
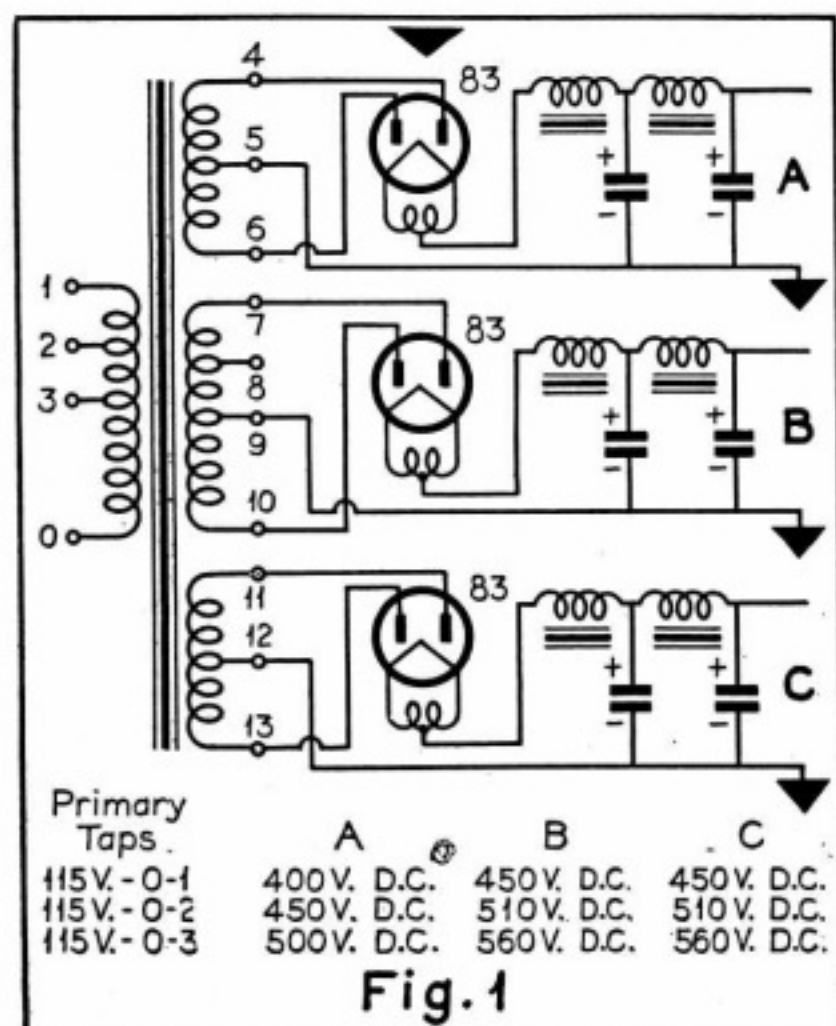

Multiple-voltage power-supply circuits using type 83 rectifiers and operating from a single power transformer (filament transformer separate.)

Fig. 2
High- and low-voltage power supply using a single 83 and two 866s in full-wave connection, both circuits supplied from a single power transformer (filament supplies separate).

Another method to eliminate this hazard is to use a separate transformer for the input or low-level stages. The drawback to this procedure is the excessive cost and is therefore not usually practical.

The answer lies in the use of a new type of transformer that permits any existing type of rectification in a practical and economical manner.

Voltages Available

The voltages available from this transformer range from 400 volts up to 3000 volts depending upon the type of circuit used. In the schematic (Fig. 1) three separate d.c. supplies ranging from 400 to 560 volts may be obtained. By means of a primary tap these voltages may be varied approximately 12 per cent. This circuit will supply adequate power to three separate audio or r.f. units.

In applications where it is necessary to have a separate low voltage and a high voltage, the circuit shown in Fig. 2, utilizing two 866 tubes and a type 83, is not only economical but very practical for many uses in amateur transmitters and experimental circuits.

Fig. 3 shows a similar application with the exception that the high-voltage supply is obtained from three low cost 83 type tubes in a bridge arrangement. In this application the high voltage supply delivers 140% of full wave rated value. The same voltages are also obtainable in Fig. 4. In this circuit the center tap of one of the high-voltage windings is connected to the filament of a type 83 tube, thereby forming a series connection.

By far the most versatile circuit is shown in Fig. 5. A single 83 is used for low voltage and two 866's connected for full-wave rectification supply the high voltage. Usually when this circuit is used in existing equipment two power transformers are re-

quired to accomplish what one will do with this new transformer.

Where higher voltages are desired the circuit of Fig. 6 may be used. This arrangement will supply a d.c. voltage as high as 1020 volts. In a circuit where such high voltages are used it is common practice to supply a lower power stage with a lower voltage. This is obtained from a separate winding using a type 83 full-wave rectifier.

High Voltages

For maximum volts per dollar expended the circuit of Fig. 7 is ideal for those whose pocketbooks are limited. A glance shows two of the high voltage windings connected in series. For rectification two type 83 tubes are connected in tandem. Low voltage is obtained from the other winding with another 83 tube. When it is not desired to utilize the low voltage the three windings may be connected in series. When used as shown in Fig. 8, with two 866 tubes, voltages ranging from 1300 to 1620 volts are procurable.

A still cheaper method of obtaining the same voltages is shown in Fig. 9. Here the outputs of three type 83 tubes are connected in series. In this circuit it is essential that the filament transformer supplying the 83 tubes be adequately insulated to withstand the high voltages.

Perhaps surpassing all circuits shown is the application in Fig. 10. In this circuit 21 different voltages are available. In transmitter use there is sufficient power available to supply anything from a five-watter up to a 500-watt rig. In addition to this a separate low-voltage supply may be taken off of the secondary winding marked 4, 5 and 6, when the high-voltage requirements are not over 2240 volts.

The above application refers to our triple winding power transformers, Type T658 and Type T659. Transformer T658 is rated to supply 175 MA. from each winding. Transformer T659 is similar to the above but designed for heavier current supplies. This unit will supply 350 MA. from each winding.

Another transformer similar to these units is Type T654. This unit is also a triple winding plate transformer which delivers 250 MA. from each winding. However, the voltages available from this unit differ as shown below.

T658-T659	T654
520-0-520	490-0-490
570-0-570	630-0-630
570-0-570	630-0-630

Thus it is seen that the 490 volt winding supplies rectified voltages 7% lower and the 630 volt windings 11% higher than the voltages shown in the 11 schematics.
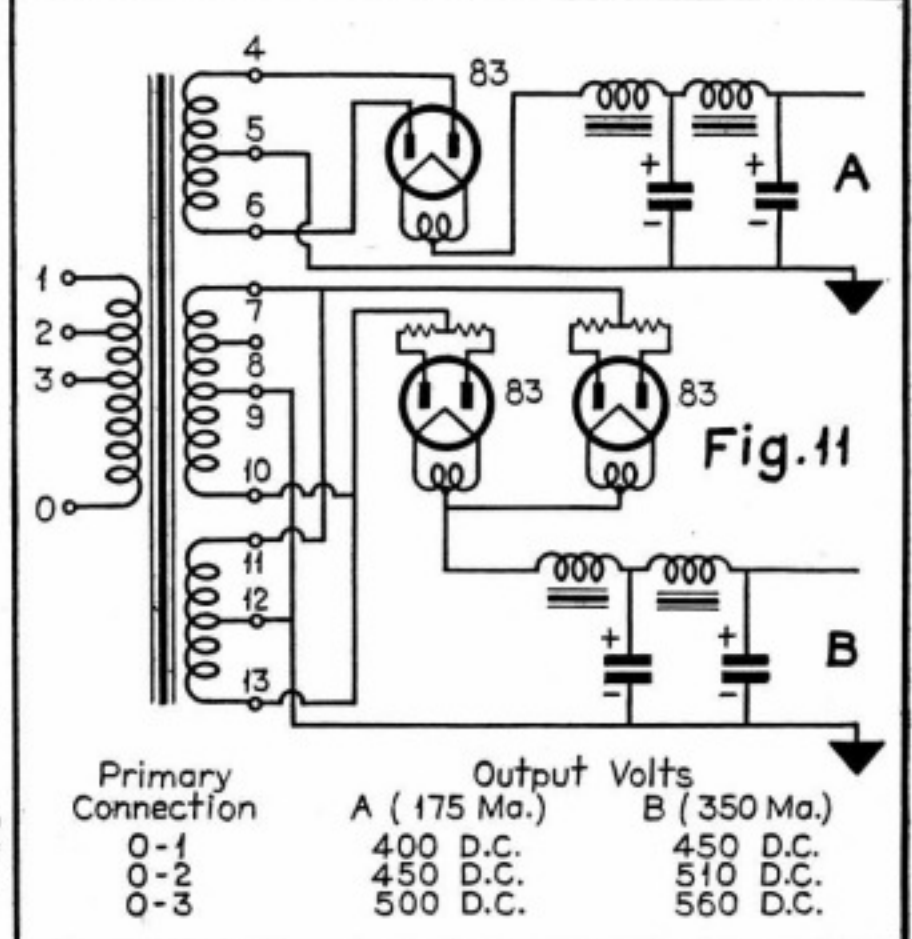

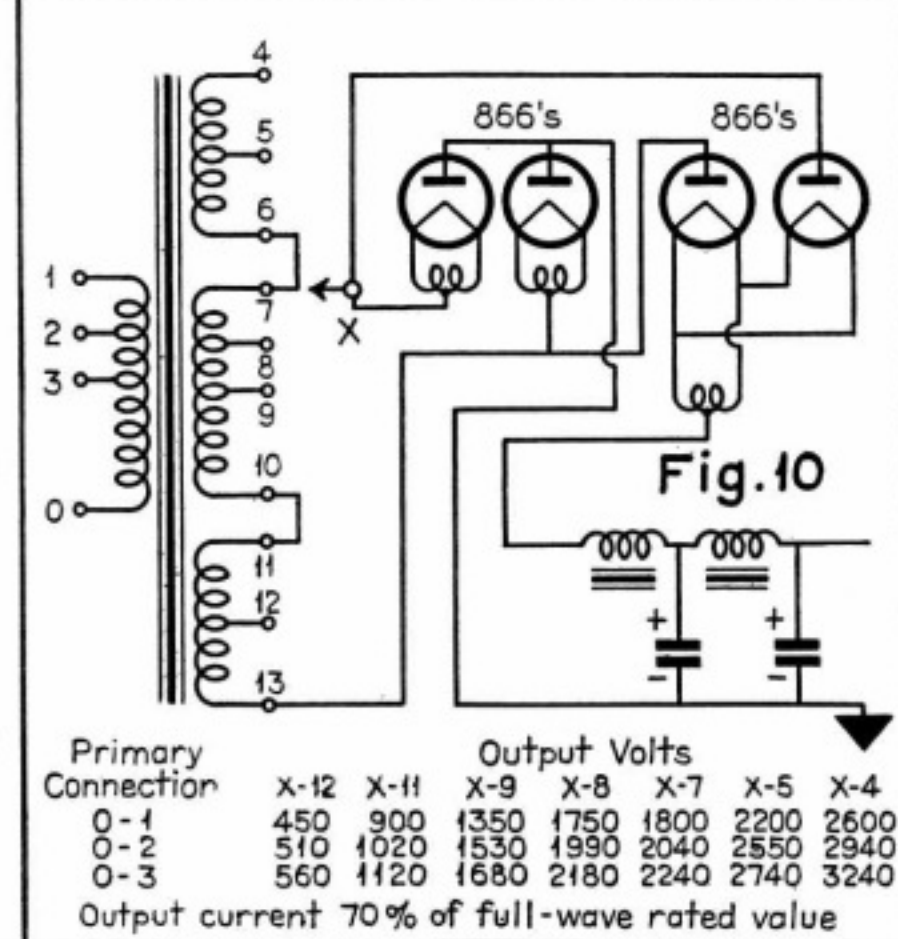

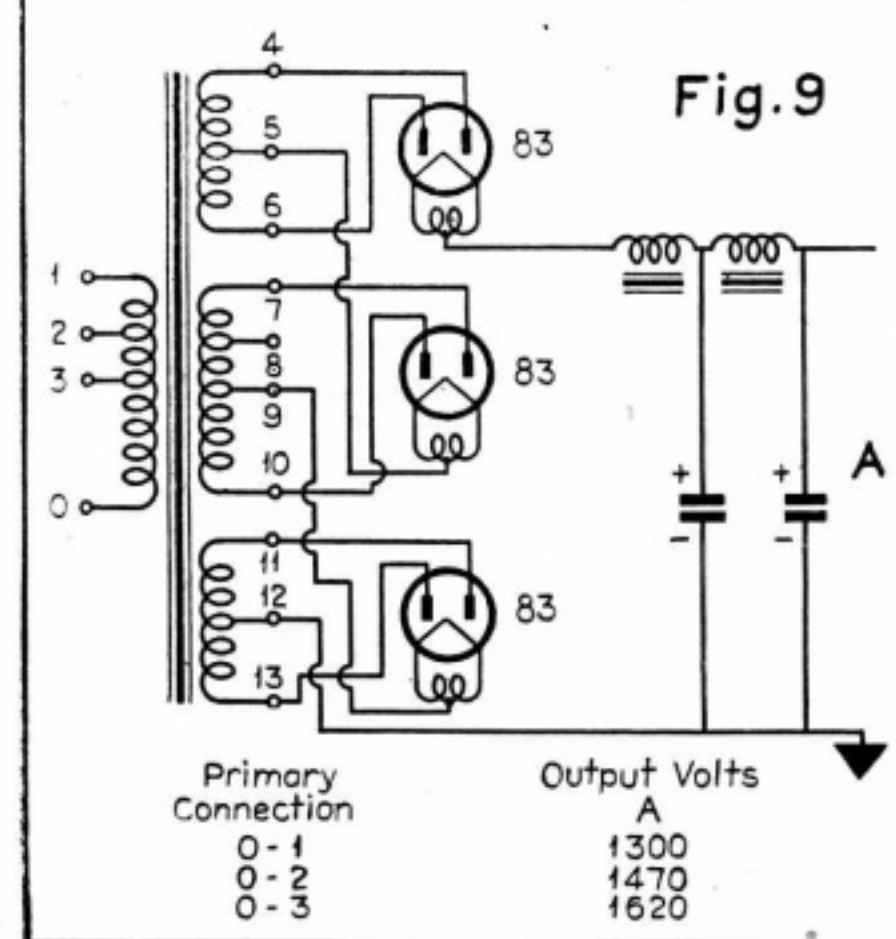

For circuits requiring exceptionally high current where the voltage requirement does not exceed 560 volts, the circuit shown in Fig. 11 is admirably suited. By connecting two of the windings in parallel the current supply is doubled in the portion of the circuit marked "B." The usual low voltage

is available from the third winding and will supply the full current ratings of the transformer.

Bridge Rectification

While this description only covers the more common types of rectification appli-

cations the amateur and experimenter will no doubt find other interesting applications. It should be noted in all applications where bridge rectification is used that the maximum output obtainable should never exceed 70 per cent of the rated output of the transformer.

Group of circuits showing the many combinations that may be had with a single universal power transformer (minus filament supply) for the purpose of deriving separate voltages of different values for the various stages of a transmitter or high-power public-address system.

KENYON AMATEUR TRANSMITTER AND PUBLIC ADDRESS COMPONENTS
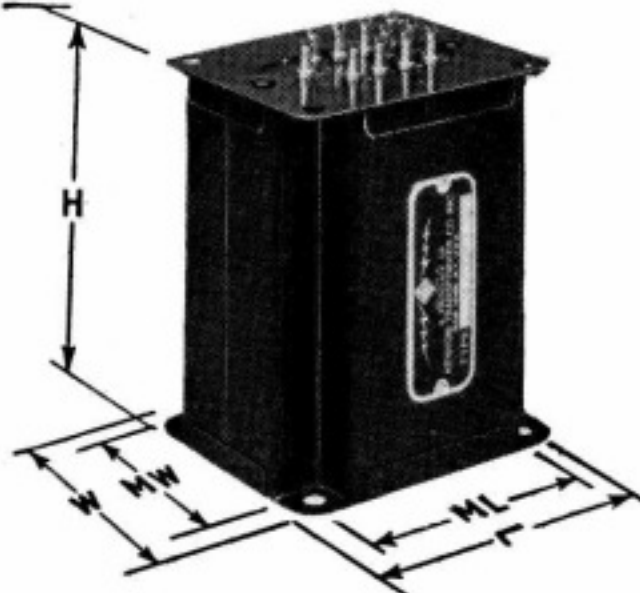

Kenyon engineers have designed this complete line of audio and power transformers and reactors to make possible a popular priced line particularly suited for amateur transmitter and public address use.

Refinements in design and controlled production result in units which are unapproachable for quality in material of this price range.

Each unit is housed in a metal case finished in a durable black eggshell enamel presenting a pleasing appearance to suit exacting commercial requirements. This case also acts as an electrostatic and electromagnetic shield.

Universal mounting facilities permit all units to be top or bottom mounted to chassis or panels.

With the exception of the high voltage units which are provided with glazed ceramic insulators all units are provided with sturdy solder lug terminals.

	For portable application use open type KR19M. List Price $1.50		
T-453	Class AB 2A3's, 45's or Class A, 6L6's to 5000 or 3000 ohms. Max. Sec. D.C. 130 M.A...........	4A	8.50
T-454	Class B 46's or 59's, 6F6's (triode or pentode) 2A5's, 42's etc. to 4000-6000-8000 ohms. Max. Sec. D.C. 140-100-75 M.A. Primary 6000 or 10,000 ohms....	4A	8.50
T-455	Class B—210's to 5000-7000-9000 ohms. Max. Sec. D.C. 180-150-130 M.A.......	5A	10.00
T-456	P. P. Parallel 45's or 2A3's Class AB to 5000-7000-9000 ohms. Max. Sec. D.C. 150-100-75 M.A......	5A	10.00
T-457	P. P. Parallel 46's, 59's, 6F6's, (triode or pentode) 2A5's, 42's etc. to 3000-5000-7000 ohms. Max. Sec. D.C. 220-160-120 M.A. Primary 3000 or 5000 ohms	5A	10.00
T-465	P. P. 838's, 203A's to 4000-6000-8000 ohms. Max. Sec. D.C. 400-320-270 M.A...........	7A	25.00
T-470	P. P. H.D. 203A's to 4000-6000-8000 ohms. Max. Sec. D.C. 500-400-350 M.A...........	8A	42.00
T-490	Single 2A5, 42 or 6F6 grid modulation transformer to grid modulate 203A's, 211's, etc...........	2A	4.50
T-491	Single 45 grid modulation transformer to grid modulate 203A's, 211's, etc...........	2A	4.50
T-458	P. P. 801's to 5000-7000-9000 ohms. Max. Sec. D.C. 150-135-110 M.A...........	6A	12.50
T-460	P. P. 800's to 6000-8000-10,000 ohms. Max. Sec. D.C. 200-175-150 M.A...........	6A	15.00
T-492	Grid or suppressor modulation transformer—P. P. 45's to 10,000 ohm load...........	3A	5.00
T-459	P. P. 6L6's Class AB$_2$ to 2500-5000-7000 ohms. Max. Sec. D.C. 300-250-200 M.A..................	5A	8.50

EMERGENCY WORK - QRR

Amateurs have always given an excellent account of themselves in many emergencies of local and national character. In every instance, the amateurs who have considered the possibilities of an emergency arising before the trouble actually came to pass were the ones who must be credited with doing the most important work. They were ready, prepared for the crisis when it came.

Be ready for the emergency call, QRR, when it comes. Jump into the breach with your station, if feasible, or stand by and avoid interference to those handling emergency traffic, if this seems to be the right thing to do. "Standing by" is sometimes the harder, but wiser course if the important communications are being handled satisfactorily by others and your traffic is "public correspondence" for individuals.

Make note of the address of railroads, of Red Cross headquarters, of local military units, police departments, representatives of press associations and the like, if possible putting your station on record with such organizations and other competent authorities so that you will be called upon to assist when emergency communication is necessary. When storms approach or disaster threatens it is best to keep in touch with the situation by radio and again to offer service to these agencies well in advance of the actual emergency. Emergency work reaps big returns in public esteem and personal satisfaction.

After emergency communications are completed, report in detail direct to A.R.R.L.

BEFORE EMERGENCIES

Be ready, with really portable sets, and emergency power supply.

Overhaul and test periodically.

Give local officials and agencies your address; explain the availability of amateur radio facilities through your station in emergencies.

IN EMERGENCY

CHECK station operating facilities; offer your services to all who may be able to use them; inform A.R.R.L. an emergency exists, if possible.

QRR is the official A.R.R.L. "land SOS," a distress call for emergency use *only* . . . for use *only* by station asking assistance.

THE KEY STATION in emergency zone is the first and the supreme authority for priority and traffic routing in the early stages of emergency relief communication.

PRIORITY must be given messages in the general public interest (relief plans, re food, medicine, necessities). Press reports and personal assurance messages can then be handled if practicable.

COÖPERATION is required of all amateurs. Don't clutter the air with useless CQs. The *majority* of amateurs must *listen in*; QRX; avoid QRMing. Be ready to help; operate as intelligently as possible; coöperate by staying off the air while vital first information and relief measures are handled, if stations able to help as well as yours are on the job. (CQ STORM AREA is nothing but "more QRM.")

AFTER EMERGENCIES

Report to A.R.R.L. as soon as possible and as fully as possible so amateur radio can receive full credit. Amateur radio communication in 33 major disasters since 1919 has won glowing public tribute. Maintain this record.
